INDEPENDENT COMMUNICATIONS AUTHORITY OF SOUTH AFRICA

NOTICE 738 OF 2021

- 1. Pursuant to section 4B of the Independent Communications Authority of South Africa Act, 2000 (Act No. 13 of 2000), hereby issues a notice regarding its intention to conduct an inquiry into the Long-Term Spectrum Outlook for public consultation.
- 2. The purpose of the inquiry is to conceptualise Scenario Plans for the Long-Term Spectrum Outlook for South Africa.
- 3. Interested persons and parties are hereby invited to submit written representations, including an electronic version of the representation in Microsoft Word, of their views on the Draft Consultation Document on Spectrum Outlook by no later than 16h00 on 04 March 2022.
- 4. Persons making representations are further invited to respond to the questions using the attached template which can be obtained on the ICASA website: www.icasa.org.za.
- 5. Written representations or enquiries may be directed to:

350 Witch-Hazel Avenue, Eco Point Office Park Eco Park, Centurion South Africa

Page | 1-1 Preamble

Private Bag X10,
Highveld Park 0169
Centurion, Pretoria, marked for the attention of:

Mr. Manyaapelo Richard Makgotlho

e-mail: rmakqotlho@icasa.orq.za

- 6. All written representations submitted to the Authority pursuant to this notice shall be made available for inspection by interested persons from 09 March 2022 at the ICASA Library or website and copies of such representations and documents will be obtainable on payment of a fee.
- 7. Where persons making representations require that their representation or part thereof be treated as confidential, then an application in terms of section 4D of the ICASA Act, 2000 (Act No. 13 of 2000) must be lodged with the Authority. Such an application must be submitted simultaneously with the representation on the draft regulations and plan. All confidential material must be pasted onto a separate annexure which is clearly marked as "Confidential". If, however, the request for confidentiality is not granted, the person making the request will be allowed to withdraw the representation or document in question.
- 8. The guidelines for confidentiality request are contained in Government Gazette Number 41839 (Notice 849 of 2018).

DR KEABETSWE MODIMOENG

CHAIRPERSON

DATE: 15/12/2021

1 INTRODUCTION

The Authority is developing a long-term spectrum outlook spanning between ten and twenty years. The consultation document contains an analysis of regulatory, technical and economic factors, including relevant regional and international best practices. The main aspects of spectrum planning include:¹

- Setting spectrum management goals for the future and to establish steps to achieve those goals;
- Provide a framework within which spectrum is made available for the constantly evolving radio spectrum needs, and the spectrum management system;
- Facilitate decision-making by creating the basis for consideration and evaluation of the course of action; and
- Support and follow the major directions and needs of the current and future spectrum users.

For example:

- Mobile spectrum needs will increase over 5 to 10 years and more (discussed in more detail in Section 4.2.1);
- The spectrum management process should attempt to anticipate those developments and ensure that adequate spectrum will be allocated to the mobile service to meet those needs; and
- To achieve this goal: capacity analysis, coordination procedures, frequency shifts and supporting databases are necessary to be able to support the accommodation of mobile systems.

The most important element for spectrum planning is the national table of frequency allocation, derived from the International Table of Frequency Allocations of the Radio Regulations (Article 5). Even though administrations may allocate frequencies according to their national needs, frequencies do not stop at the border but spill over into neighbouring countries. Frequencies should be assigned to compatible services especially near the borders in order to avoid harmful interference.

Good planning is crucial for achieving the economic and social benefits of spectrum. It can facilitate radiocommunication growth especially when the demand for spectrum increases, for preventing interference and for the identification of spectrum for future needs. Considering that the use and technology development in this domain is dynamic, it is important that long term planning is flexible:

- Any commitment to long term planning must include a commitment to a process of regular revision and review in which spectrum managers regularly reconsider plans in the light of developments; and
- It is possible that a projected service will not develop as anticipated for technological or economic reasons

Thus, spectrum planning should not be rigid and dogmatic: It should avoid irreversible decisions, but should survey a long period of time to set out a path to achieve spectrum management objectives, derived from legislation and government policy.

Spectrum planning should cover any of the spectrum management actions or decisions that directly govern how spectrum will be used, such as:

- Allocations, policies, allotments, assignment rules and standards;
- Actions in each of these areas determine how bands will be used, how radio services are implemented, which technologies will be accepted or if the market alone decides which technologies prevail.

Page | 1-7

Consultation section

¹ See, for instance, report ITU-R SM.2015.

In this context, the national allocation table serves as the primary plan for spectrum use and other planning actions form subsets of that framework. Planning should also take into account factors such as:

- Significant shifts in spectrum use (including re-farming);
- Emerging technologies;
- New services for which there are no current allocations;
- User plans for changes in use;
- Projected crowding in specific bands; and
- Any changes due to WRC (changes made to Article 5).
- The IMT Roadmap
- The Frequency Migration Plan (FMP)

It is also important to consider:

- Inventory of spectrum users and to identify what spectrum is available, including: The number of
 spectrum users, relevant characteristics of the radio stations, geographical distribution of the radio
 stations, potential influence of the radio stations on one another.
- Current use based on the national frequency register. This register should contain technical and management information, such as:
 - o Frequency, user name, location, equipment used, costs involved with system implementation and details of technical characteristics; and
 - If used for international communication, the national register should be supplemented by the ITU Bureau Radiocommunication (BR) International Frequency Information Circular (IFIC).
- Information obtained through spectrum monitoring on the actual use of frequencies to supplement the national register; and
- Exchange of information with other administrations as it will have an impact on spectrum users outside the national borders.

There are a range of policy and legal factors that affect spectrum planning:

- National radiocommunication laws, regulatory requirements, ITU frequency allocation table, user needs, security and public safety, regional frequency management bodies, standardization policy, etc.
- Economic factors: Market demand, spectrum auctions or fees, procedures and practices used by service providers, overall economic growth, etc.
- Social and ecological factors; Changes in demand as a result of changes in social structure, electromagnetic pollution and radiofrequency interference, etc.
- Technical factors: User mobility, signal processing, communication media, coding and modulation techniques, antenna design and characteristics, etc.

The remainder of this document is set out as follows. First, the underlying regulatory framework is described, together with policy objectives, in Section 0. The economic impact of broadband, and key trends for spectrum management, are discussed in Section 3. The spectrum outlook is then considered in Section 4, in respect of key service allocation categories. Frequency migration and costing is then discussed in Section 5, and tables of acronyms and abbreviations are provided in the appendix (Section 8).

Each of the sections contain questions on which a response from the stakeholders is required. These responses will guide ICASA in preparing the Spectrum Outlook document for Long Term (up to 20 years).

Page | 1-8 Consultation section

2 REGULATORY FRAMEWORK AND POLICY OBJECTIVES

The Authority's objectives where spectrum management in South Africa is concerned are set out in the Electronic Communications Act No 36, 2005 ('the ECA'). There are also several government policies that inform radio frequency spectrum planning. The first is the National Development Plan 2030 ('NDP'), published in 2011, which considers a number of policy questions relating specifically to radio frequency spectrum. Second, the SA Connect policy provides South Africa's national broadband plan, which includes targets for broadband speeds, among other objectives. Third is the Strategic Infrastructure Plan 15 - Expanding access to communication technology ('SIP-15'). Fourth is the Communications Regulators' Association of South Africa ('CRASA') regulatory principles for mobile financial services. Additionally, the African Telecommunications Union ('ATU') has launched spectrum recommendations that are relevant for radio frequency spectrum planning. Each of these regulatory and policy documents are discussed in turn in this section.

2.1 THE ECA ON FREQUENCY SPECTRUM MATTERS

The Authority's main objective related to spectrum planning, set out in Section 2 of the ECA, is to: "ensure efficient use of the radio frequency spectrum". In addition, the Authority has a range of obligations with respect to the control of radio frequency spectrum:

Section 30 of the ECA says that:

- (2) In controlling, planning, administering, managing, licensing and assigning the use of the radio frequency spectrum, the Authority must—
- (a) comply with the applicable standards and requirements of the ITU and its Radio Regulations, as agreed to or adopted by the Republic, as well as with the national radio frequency plan contemplated in section 34;
- (b) take into account modes of transmission and efficient utilisation of the radio frequency spectrum, including **allowing shared use of radio frequency spectrum** when interference can be eliminated or reduced to acceptable levels as determined by the Authority;
- (c) give high priority to applications for radio frequency spectrum where the applicant proposes to utilise digital electronic communications facilities for the provision of broadcasting services, electronic communications services, electronic communications network services, and other services licensed in terms of this Act or provided in terms of a licence exemption.

[emphasis added]

The use of radio frequency spectrum for broadcasting and electronic communications services and network services features prominently in the ECA, and spectrum sharing is promoted.

In addition, Section 34 of the ECA sets out that the Authority must have regard to internationally accepted methods for radio frequency planning:

- (7) In preparing the national radio frequency plan as contemplated in subsection (4), the Authority must—
- (a) take into account the ITU's international spectrum allocations for radio frequency spectrum use, in so far as ITU allocations have been adopted or agreed upon by the Republic, and give due regard to the reports of experts in the field of spectrum or radio frequency planning and to internationally accepted methods for preparing such plans;

This spectrum outlook consultation document has been prepared taking into account such internationally accepted methods, including in respect of considering international trends in spectrum demand.

Page | 2-9 Consultation section

2.2 THE NATIONAL DEVELOPMENT PLAN AND SIP 15.

The National Development Plan 2030 for South Africa ('NDP') provides a framework for economic development, including for the information and communications technology ('ICT') sector.² The NDP emphasizes the development of a knowledge-based economy and information society. The plan considers the development of a seamless ICT infrastructure delivering services to consumers, businesses and the public sector, at competitive levels of cost and quality. In respect of planning and policy priorities, the NDP considers, in relation to radio frequency spectrum:

- Affordable, widely available broadband for economic and social development.
- An ICT sector that enables economic activity.

The NDP emphasizes broadband, and an ICT sector that supports economic activity. SIP-15 (described in Box 1) will play a role in developing the infrastructure needed to achieve this. There are also a number of activities relating to spectrum, including:

- Implement a service and technology-neutral flexible licensing regime to allow flexible use of resources in dynamic and innovative sectors, especially for spectrum that should be made available urgently for next generation services.
- Free spectrum for efficient use, to drive down costs and stimulate innovation.
- Spectrum can be allocated with set asides or obligations to overcome historical legacies and inequalities in the sector, but this should not delay its competitive allocation.

These activities propose technology neutrality and the roll out of innovative new services, reducing costs, and ensuring that spectrum is competitively allocated, important objectives for spectrum planning in South Africa.

Box 1: SIP 15.

A further important government policy is SIP 15: Expanding access to communication technology. SIP 15 provides for broadband coverage to all households by 2020 by:³

- establishing core Points of Presence (POPs) in district municipalities
- extend new Infraco fibre networks across provinces linking districts
- establish POPs and fibre connectivity at local level
- further penetrate the network into deep rural areas.

The SIP 15 considers that the private sector will invest in ICT infrastructure for urban and corporate networks, and government will co-invest for township and rural access, as well as for e-government, school and health connectivity. More recently, SIP 35 envisages rolling out SA Connect Phase 1B.⁴

2.3 SA CONNECT

The 'South Africa Connect' broadband policy ("SA Connect") published by the Department of Communications in 2013 emphasizes the links between broadband access and growth, stating that

Page | 2-10 Consultation section

³ See: https://www.gov.za/sites/default/files/PICC Final.pdf

⁴ See: https://www.gov.za/sites/default/files/gcis document/202007/43547gon812.pdf

although there may be variation in the findings of different studies on the precise economic impact of broadband.⁵

"there is enough evidence to support claims that increases in broadband penetration are correlated with increases in Gross Domestic Product (GDP), new jobs, broadening of educational opportunities, enhanced public service delivery and rural development".

The SA Connect report furthermore recognises that access to broadband (fixed and mobile) has lagged in South Africa relative to expectations as well as international comparators. This has particularly been highlighted with respect to fixed services. SA Connect highlighted the slow deployment and high costs of fixed broadband services, raising concerns over the fact that these costs have meant that mobile services have become a primary form of broadband access rather than a complementary form as has occurred in other mature economies.

In addition, several other constraints were identified:

- There was insufficient investment in networks: The development of national terrestrial
 networks and a high capacity access network were seen as a critical infrastructure constraint in
 the SA connect report. SA Connect highlights costs of leasing facilities from the incumbent
 operator, and the lack of large-scale investment in networks as an issue impacting on
 competitiveness.
- South Africa has low broadband penetration relative to other lower-middle-income countries: South Africa had fixed household penetration of 11% while its peers had an average of 34%. LTE coverage was 60% at the time of the publication of SA Connect, but speeds are lower than the global average.

These constraints have important implications for spectrum planning in South Africa, since the lack of fixed line penetration means significantly greater reliance on mobile services for broadband connectivity. The lack of broadband uptake and usage and relatively slow LTE speeds in South Africa suggest that larger radio frequency spectrum allocations for mobile and fixed-wireless access are needed in order to reduce the costs of broadband.

The targets set out in SA Connect, and in particular the broadband access speed target for 100MBbps by 2030, are shown in Table 1. These targets provide important parameters for spectrum planning in South Africa. National broadband plans in other African countries are described in Box 2, and have similarly ambitious targets.

Table 1: SA Connect targets

Target	Penetration measure	Baseline (2013)	By 2016	By 2020	By 2030
Broadband	% of	33.7%	50% at 5	90% at 5	100% at
access in	population	Internet	Mbps	Mbps	10Mbps
Mbps user		access		50% at	80% at
experience				100Mbps	100Mbps
Schools	% of schools	25%	50% at 10	100% at	100% at
		connected	Mbps	10Mbps	1Gbps
				80% at	
				100Mbps	
Health	% of health	13%	50% at	100% at	100% at
facilities	facilities	connected	10Mbps	10Mbps	1Gbps

Page | 2-11 Consultation section

_

⁵ Department of Communications, December 2013, 'South Africa: Creating opportunities, ensuring inclusion. South Africa's broadband policy.', Government Gazette number 37119.

Target	Penetration measure	Baseline (2013)	By 2016	By 2020	By 2030
				80% at 100Mbps	
Public sector facilities	% of government offices		50% at 5 Mbps	100% at 10Mbps	100% at 100Mbps

Box 2: National broadband strategies in other African countries

Kenya's NBS⁶ provides one example of how the ATU's recommendations on spectrum management could be utilized. Spectrum management is defined as facilitating 'converged service availability and maximize value and use of spectrum' - this includes:

- Ensuring flexibility in spectrum licensing and authorization (e.g. spectrum trading)
- Flexible usage rules for existing licenses
- Internationally harmonized band plans during allocation and assignment of spectrum
- Market mechanisms used to assign spectrum
- Making sure that spectrum management is responsive to the market realities and in line with best-practice

The NBS acknowledges that worldwide spectrum authorities are making various decisions about how best to utilize spectrum, alongside driving technology and investment across connectivity platforms and services - including end user broadband access, backhaul, broadcast, fixed terrestrial, fixed satellite and mobile services. Kenya's NBS thus views their broadband policy reform as being underpinned by the principles of flexibility – for spectrum licensing, authorizations, and rules of use. The principles of spectrum policy thus include:

- a) Ensure there is always sufficient supply of spectrum available reducing the barriers to entry by service provider barriers, as well as increasing competition and innovation. Spectrum allocation will be re-evaluated periodically by the Government of Kenya to ensure that it is efficiently utilized.
- **(b) Promote flexible use** ensuring that spectrum policies are flexible enough to allow multiple party use in unserved and underserved areas. Additionally, policies must promote flexible use of spectrum and sharing across users and platforms (e.g., mobile, satellite, and new technologies like high altitude platform stations (HAPS and Terragraph) in order to increase the spectrum available for broadband.
- **(c) Balance licensed and unlicensed spectrum** policy needs to support both allocations and promote technology neutrality. In circumstances where the case for deployment of one is less attractive, licence fees need to be set in a way that ensures that investment incentives are balanced.
- **(d) Promote both the capacity and coverage of networks** it is imperative that the Kenyan Government engage in policy that not only enhances network capacity, but also expands coverage to underserved areas and populations.

Nigeria's National Broadband Plan (NBP 2020-2025)⁷ places emphasis on regulatory rules and conditions being clear, non-discriminatory and easily manageable - with fair and competitive access

Page | 2-12 Consultation section

⁶ See: https://www.ict.go.ke/wp-content/uploads/2019/05/National-Broadband-Strategy-2023-FINAL.pdf

⁷ See: https://ncc.gov.ng/documents/880-nigerian-national-broadband-plan-2020-2025/file

to spectrum. This is required in order to enhance competition in the telecommunications market - encouraging investor confidence and so enabling society to benefit from the process. Investment would also support the development of new mobile technologies and platforms (such as 5G) that can address socioeconomic challenges in the country.

Nigeria's NBP has been designed with the target to deliver data download speeds of 25Mbps minimum in urban areas, and 10Mbps in rural areas by 2025 (respectively 10Mbps and 5Mbps by 2023). This is in the overall context of a target towards at least 90% of the population having effective broadband coverage by 2025 - at a maximum price of N390 per 1GB of data (2% of median income or 1% of minimum wage). The plan targets the full deployment of 4G LTE networks, noting that the existing 2G and 3G services are unable to achieve these kinds of download speeds with large population numbers.

2.4 CRASA

In 2019 CRASA published the 'Key Regulatory Principles and Guidelines for Mobile Financial Services'. This provides guidance with regards to the role of CRASA members. The following are key recommendations to the National Regulatory Authorities (NRA) in SADC:

- a) A collaborative approach to regulation;
- b) MoUs between the different regulators in order to address overlaps between different sectors;
- c) Service specific regulations rather than institutional based regulations; and
- d) Enabling cross-border transactions.

Additionally, in 2019 the 'Mobile Broadband Gap Analysis Guidelines' was produced as a set of recommendations for SADC countries in order to work towards the goal of 'a harmonised pursuit for universal broadband access in the region'⁹. The guideline includes 6 steps, with full explanations that cover the tasks, inputs and outputs required:

- **1 Source input data:** This essentially includes two tasks. Firstly, sourcing, validating and blending input data from MNOs including mobile broadband subscriber numbers, average prices, network coverage, unit costs, etc. Secondly, sourcing and validating other input data (population, population density, spectrum tables, etc).
- **2** Analyse the connectivity gap: Identifying the geographical regions and population / addressable market (age 6 years and older) that are covered by either: mobile broadband service, by 2G only, or those with no coverage. This data is then used to quantify the connectivity gap (by numbers and percentages) and create an infrastructure index that assess the lack of infrastructure using GSMA enabler, dimension and indicator scores.
- **3 Analyse the demand gap:** Estimate the demand gap (broadband coverage broadband penetration), then pull out the affordability (price as % of GNI per capita at PPP) using metrics for services and installation. Use GMSA scores to create affordability index, consumer readiness index and a local content index. Finally, analyse the demand gap drivers in order to update mitigation programmes considering affordability, digital literacy and local content.

Page | 2-13 Consultation section

This gazette is also available free online at www.gpwonline.co.za

⁸ See: https://www.crasa.org/common_up/crasa-setup/18-04-2019-1555573441-publication.pdf

⁹ See CRASA. 2019. 'Mobile broadband gap analysis guidelines edition 2019', available at: https://www.crasa.org/crasa-publications-details/id/255/mobile-broadband-gap-analysis-guidelines-edition-2019/

- **4 Analyse spectrum availability:** Use the spectrum roadmap (if it exists) and GSMA spectrum dimension and indicator scores in order to identify and remove any spectrum-related barriers that either increase costs or delay MNOs from closing the connectivity or demand gaps.
- **5 Analyse the investment gap:** This is based on the coverage gap, demand gap and spectrum analyses, alongside blended network unit costs from the MNOs.
- **6 Deliver results:** Using the results from steps 2-5, put together a Mobile Broadband Gap Analysis Report. Then review the report internally and with relevant industry stakeholders, and finally submit the report to CRASA.

Thus, spectrum availability for broadband, and in particularly assessing inputs from mobile network operators, are important areas of emphasis in the CRASA approach to broadband planning.

2.5 ATU

In April 2021, ATU launched the 1st set of 'ATU Spectrum Recommendations' 10. This consists of four documents that give guidance towards the fast-track roll out of technology across the continent. These recommendations serve to enable the CSPs in having access to spectrum amounts and types that allows for the development of a variety of use cases, as well as meeting the increasing communication demand and preparing for delivery of new technologies - such as 5G. The recommendations also encourage SADC countries to enable spectrum sharing by giving licensees the right to share their spectrum voluntarily through trading and national roaming agreements.

The recommendations place emphasis on the importance of awarding the radio spectrum in a 'timely, predictable and cost-effective fashion'. This would support affordable, high-quality delivery of ICT services and stimulate initiatives in smart technology. These spectrum management principles include strategies for National broadband spectrum plans, licencing roadmaps, and emerging and future spectrum management. A summary of the recommendations include:

- Develop a national broadband plan that includes spectrum plans in support of the roll-out of mobile broadband (reviewed annually). This should consider the development of a 'Spectrum Roadmap' that includes a plan to make spectrum available for new technologies and demand for mobile broadband services (existing and future). In addition, licensing should be technology-neutral and allow for service innovations - flexibility to accommodate new and emerging technologies within existing licensing frameworks.
- 2. Estimate future spectrum requirements for broadband, taking into account 'geographic status cities, population density, average spectral efficiency for different planned technologies, forecasted number of subscribers, and behaviour of users'.
- 3. Support broadband deployment by developing a 5 10 year spectrum outlook.
- 4. Open up opportunities for innovative spectrum access models, including reallocation or repurposing of spectrum.
- 5. Transparency in spectrum allocation and utilization.
- 6. Plan for the availability of all mobile broadband spectrum (and backhaul spectrum). This would include sufficient quantities of low, mid, and high bands for the rollout of broadband (licenced and licence-exempt).

Page | 2-14 Consultation section

 $^{^{10}} See: \ https://www.atuuat.africa/2021/05/12/the-african-telecommunications-union-launches-the-1 st-set-of-atu-spectrum-recommendations/$

- 7. A clear timeline for the release of additional mobile broadband spectrum (short term, medium term and long term).
- 8. Identify future technological trends (spectrum sharing mechanisms and emerging standards) and their impact on spectrum policy and planning.
- 9. Monitor the implementation of broadband spectrum plans.
- 10. Flexibility in spectrum regulation in order to ensure efficiency in spectrum use. This would include the development of a spectrum sharing framework for mobile broadband, developing models for spectrum trading, encouraging network deployments by National Roaming (particularly in rural, unserved and underserved areas), 'Use it or lose it' / 'Use it or Share it' obligations on spectrum licenses, and allowing for staggered/instalment payments for settling spectrum fees.
- 11. Accommodating emerging technologies and standards that would extend mobile broadband networks into unserved and underserved areas.
- 12. Coordinated standards for reflecting information within spectrum licensing and usage databases.
- 13. Standardize frequency allocations for wireless broadband regionally, allowing for the reduction of border interference and supporting common technical standards.
- 14. Maximize spectrum efficiency for broadband services with the use of techniques such as band planning approaches and the incorporation of innovative authorization approaches and technologies.
- 15. Study various propagation models that cover a variety of different environments, so as to accommodate future mobile broadband services while taking into account the characteristics of the cell radius and the antenna parameters.

The ATU recognizes the importance of identifying future technological trends, including those on spectrum sharing mechanisms, and emerging standards. Thereafter, it is recommended that an assessment is carried through on the impact on spectrum policy and planning¹¹.

Consultation question:

Please comment on whether the above captures the relevant regulatory and policy aspects of long term spectrum planning.
Comment:

2.6 SARAO

2.6.1 RADIO ASTRONOMY

The Astronomy Geographic Act, 2007 (AGA Act No. 21 of 2007) provides the legal basis and framework for the declaration of astronomy advantage area and protection of such areas from harmful radio frequency interference that may hamper the cosmic observations by scientific instruments located within those areas. The authority develops the national spectrum allocation, assign frequencies to licensees, and monitor compliance with license terms. The Astronomy Management Authority (AMA) within the Department of Science and Innovation was assigned to manage the declared Karoo

Page | 2-15 Consultation section

 $^{^{11}\,}See: https://www.atuuat.africa/wp-content/uploads/2021/04/English-ATU-R-Spectrum-Recommendation-004-0.pdf$

Central Astronomy Advantage Areas (KCAAAs). The Authority gave notice to all radio frequency spectrum licensees operating within the KCAAAs to apply for a permit with the AMA in terms of KCAAAs Regulations; through GG No. 42080 under Notice No. 765 of 4 December 2018. This section provides information on the regulatory framework established for the protection of radio astronomy in South Africa.

2.6.2 DECLARATION OF ASTRONOMY ADVANTAGE AREAS

The Minister responsible for science and technology may declare any area or part of an area in the Province of the Northern Cape as an astronomy advantage area to be protected, preserved and properly maintained in respect of radio frequency interference or interference in any other way.

- i. The whole of the territory of the Northern Cape Province excluding Sol Plaatje Municipality is declared for radio astronomy purpose, as Declared in GG No. 32951 Notice No. 115 of 19 February 2010
- ii. The Karoo Core Astronomy Advantage Area (KCoreAAA) is used for the purposes of radio astronomy and related scientific endeavors, as declared in GG No. 33462 Notice No. 723 of 20 August 2010.
- iii. The Karoo Central Astronomy Advantage Area (KCAAAs) is used for the purpose of radio astronomy and related scientific endeavors, as declared in GG No. 37434 Notice No. 198 of 12 March 2014.

The purpose of the declaration of areas as astronomy advantage areas is to ensure that the geographic area, which are suitable for astronomy and related scientific endeavors is protected, preserved and properly maintained in accordance with good national and international practices.

2.6.3 REGULATIONS OF ASTRONOMY ADVANTAGE AREAS

The Minister responsible for science and technology may make regulations for the management and protection of astronomy advantage areas.

- i. Regulations on radio astronomy protection levels in astronomy advantage areas declared for the purpose of radio astronomy were published in Government Gazette No. 35007 under Notice No. R. 90 of 10 February 2012.
- ii. Regulations to prohibit or restrict certain activities in the core astronomy advantage areas declared for the radio astronomy purposes were published in Government Gazette No. 35450, under Notice No. R. 465 of 22 June 2012.
- iii. Regulations on the protection of the Karoo central astronomy advantage areas declared for the purpose of radio astronomy were published in Government Gazette No. 41321, under Notice No. 1411 of 15 December 2017.

The Minister obtained concurrence of ICASA when making regulations for prohibiting or restricting activities that have an adverse effect on astronomy and related scientific endeavors.

2.6.4 ASTRONOMY DEVICES

The Minister may declare any existing or proposed scientific endeavor to be astronomy and related scientific endeavors for the purpose of the Astronomy Geographic Advantage Act.

i. The establishment and operation of MeerKAT telescope is declared a scientific endeavor in Government Gazette No. 33614, under Notice No. 897 of 15 October 2010.

Page | 2-16 Consultation section

- ii. The establishment and operation of Square Kilometre Array (SKA) telescope is declared a scientific endeavor in Government Gazette No. 33614, under Notice No. 897 of 15 October 2010.
- iii. The operation of C-BASS telescope within the spectrum between 4.5 GHz and 6.5 GHz is declared a scientific endeavor in Government Gazette No. 36826, under Notice No. 684 of 13 September 2013.
- iv. The development and operation of PAPER telescope and HERA telescope within the spectrum between 100 MHz and 200 MHz is declared a scientific endeavor in Government Gazette No. 36826, under Notice No. 684 of 13 September 2013.

2.6.5 SPECTRUM LIST EXEMPTED FROM PROHIBITION

From one (1) year after the date that KCAAAs Regulations become operational, no licensee or license exempted operator shall use, or continue to use the radio frequency spectrum from 100 MHz to 25.5 GHz to conduct radio transmissions within the declared KCAAAs, unless the spectrum is exempted from prohibition. The Minister published a list of the radio frequency spectrum and applications that are exempted from the prohibition of use for transmissions located within the KCAAAs in Government Gazette No. 45045, under Notice No. 753 of 26 August 2021.

2.6.6 ASTRONOMY FACILITIES WITHIN THE DECLARED AREAS

The use of radio frequency bands in the areas declared as Karoo Core and Central Astronomy Advantage Areas are regulated as follows:

Unless required for the purpose of radio astronomy and related scientific endeavors the use of the radio frequency spectrum in Table 1 is restricted within the declared as Karoo Core and Central Astronomy Advantage Areas.

Table 1: Restrictions on the use of radio frequenc	y spectrum
--	------------

Declared Area	Prohibited Band
KCoreAAA	9 kHz to 3 000 GHz
KCAAA 1	100 MHz to 2 170 MHz
KCAAA 2	100 MHz to 6 GHz
KCAAA 3	100 MHz to 25.5 GHz

3 SPECTRUM MANAGEMENT AND ECONOMIC IMPACT

3.1 IMPACT OF BROADBAND

As set out above, the NDP, SA Connect, CRASA and the ATU all consider broadband services as playing an important role in economic development. In this section, the Authority considers the impact of broadband on economic growth in more detail.

The effects of broadband on economic growth can be categorised as 'direct' in terms of the investments in infrastructure and the actual rollout, and 'indirect' in terms of the services and capabilities enabled by broadband access which in turn drive economic growth. These include, for example, its positive impact on innovation, firm productivity and the development of consumer applications and services

Page | 3-17 Consultation section

¹² Organisation for Economic Co-operation and Development (OECD). (2007). Broadband and the Economy: Ministerial Background Report DSTI/ICCP/IE(2007)3/FINAL. Available here.

which enhance consumer surplus.¹³ Through facilitating the improved efficiency of Information and Communication Technologies (ICT), broadband access allows for innovation in terms of how and where economic activity takes place,¹⁴ a factor which is especially important in the context of rural development initiatives in South Africa. There may also be 'induced' effects which arise from the household spending based on income derived from the direct and indirect effects.¹⁵

It is important to note that the impact of broadband access on economic growth depends, in part, on the level of penetration of broadband. Higher rates of penetration (above 20% in some studies) lead to a higher contribution to economic growth¹⁶, which has to do with establishing critical mass, scale economies in provision and network effects whereby there are greater benefits to individual users if there is a greater number of other people also making use of the technology. Benefits may also decline beyond a certain level of penetration¹⁷. Levels of penetration in South Africa are considered to be suboptimal (as discussed in more detail below), such that there are likely to be significant benefits from increasing access for some time to come. Furthermore, given a low base in terms of broadband coverage in South Africa (owing to slow rollout of fixed-line access, delays in LLU, and regulatory constraints, amongst other factors discussed in the ITA), gains to consumers from increased access are likely to be high, particularly in rural and under-developed settings.

Most studies internationally find a positive (and in many cases causal) relationship between broadband penetration and GDP growth. At the same time, there is a risk that broadband may lead to the displacement of labour for capital in developing countries and SMEs may take time to adapt their business processes to using internet-based functionality to improve their operations. Nonetheless, it is important to highlight that recent research by Hjort and Poulsen (2019) shows that the expansion of high-speed internet access in African countries, including South Africa, results not only in greater employment but in greater productivity as well. Broadband access has also been shown to lead to benefits in terms of productivity in sectors with high labour intensity (such as tourism), which aligns with the emphasis in the NDP on growth and development of labour-intensive sectors. It is therefore likely that expanding access to broadband services in South Africa will lead to greater economic growth, productivity and employment.

Consultation question:

2. Are there services, in addition to broadband, that ought to be considered as important for economic growth? If so, please explain what these services might be and what the trade-offs are between using spectrum for broadband and alternative services. Please provide any evidence from other countries that may be relevant.

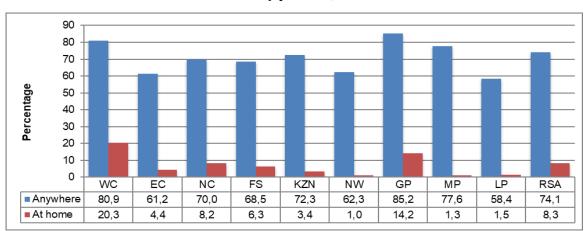

Comments:

3.2 BROADBAND PENETRATION IN SOUTH AFRICA

Based on the General Household Survey for 2020 (published in December 2021), approximately 74.1% of households in South Africa had at least one member who used the internet either at home, work, at a place of study or internet cafes, which has increased significantly from 32.9% in 2011, though in more recent years appears to have plateaued (2019: 63.3%, 2018: 64.7%, 2017: 61.8%).²² In 2020 we saw an increase of approximately 10%. The distribution of access has been uneven and many households remain without any access to internet. Importantly, access to the internet is driven by the use of mobile phones²³ which speaks to the importance of distributing additional spectrum to enhance (mobile) broadband service provision.

In most provinces other than Gauteng and the Western Cape, internet access at the home is at alarmingly low levels (below 10%). Internet access by any available means was also very low in the mainly rural provinces, including Limpopo (58.4%) and the Eastern Cape (61.2%).²⁴

Figure 1: Percentage of households with access to internet at home, or for which at least one member has access to or used the internet by province, 2020

Source: Statistics South Africa General Household Survey Report 2020, publication P0318

The potential for growth in internet access and adoption of various ICTs in areas outside of the major metros and economic centres remains very large. For example, the use of ICTs other than mobile phones

Page | 3-19 Consultation section

²² Statistics South Africa General Household Survey Report, 2011 and 2020.

²³ StatsSA (2020).

²⁴ StatsSA (2020).

(fixed-line telephones, computers and the internet) among informal businesses has historically been very low.²⁵

In formal businesses, the situation is somewhat different with greater adoption of internet services. Surveys of South African SMEs²⁶ have found positive correlations between the use of a webpage and business profitability and estimate that approximately 63% of formal SMEs actually had a website.²⁷ The direction of causality is not clear in this regard, and it may be that more profitable businesses are more likely to use a website, although it is nonetheless significant that higher profitability is associated with usage of ICTs. This is consistent with findings in a BCG study indicating that high web use SMEs showed higher revenue growth (by approximately 22%) than low or no web use SMEs in 11 G-20 economies.²⁸ SMEs use internet access for various functions including staff recruitment, geographic expansion, improved marketing, better customer interaction, and use of cloud services and online platforms such accounting functions which reduces capital requirements.²⁹

Katz (2013) finds at a high level that the conservative broadband investment of R65 billion which is envisaged in the SA Connect policy could result in the creation over ten years of 435,000 jobs and a total contribution to GDP of R130 billion.³⁰ The majority of the impact estimated is through direct effects. The assessment uses input-output tables to estimate the direct (short term) impacts on employment and production of broadband construction, and estimates medium and long term effects and externalities in the economy as a whole by looking at a digitization index within an endogenous growth model which links GDP with the fixed capital stock, labour force and level of digitization. The digitization index comprises various measures relating to affordability, infrastructure reliability, capacity, usage and human capital aspects of ICT in general, rather than broadband in isolation. This raises concerns about the applicability of the analysis for drawing conclusions on the impact of interventions in broadband, and potential endogeneity. Nonetheless, the findings overall are consistent with other studies on the South African market and internationally.

Given South Africa's challenges in terms of access to basic needs and services amongst the poorest in the population, it is significant that greater access to the internet across the population can enhance service delivery and access. For example, various ICT-based education programmes have been launched as well as 'telemedicine' services which enable medical specialists to connect with hospitals and patients in rural settings.³¹

Innovation based on internet-based platforms and digitisation has also grown significantly and is projected to increase in future. Furthermore, a large proportion of social media services such as WhatsApp and Facebook, banking and e-commerce services are now used via mobile services.³²

The potential for innovation in internet-based platforms and services will no doubt lead to benefits for businesses in terms of reducing transaction costs and allowing firms to expand the geographic reach of

their operations.³³ Consumers also stand to benefit, and have already gained, from access to new internet-based services and mobile platforms that provide greater convenience, safety and reduce costs, such as mobile and internet banking.

A key question, however, is the low rates of uptake of mobile broadband in South Africa, as shown on Figure 1, given almost full coverage of at least 3G services reported by MTN and Vodacom. One possible explanation for this is affordability, and therefore pricing of data services. A barrier to lower mobile data prices in South Africa which has frequently been cited is the lack of spectrum assigned to the mobile operators. This is since having access to spectrum lowers the cost to operators of rolling out both improved coverage and capacity, since it requires them to build fewer base stations. In addition, large amounts of spectrum are necessary to provide high speed mobile broadband, especially as the demand for data increases rapidly. If operators with inadequate spectrum assignments are struggling to meet data capacity requirements from their existing customers, this lowers their incentive to reduce prices as lower prices will lead to higher volumes which could result in declining network quality. There are therefore a number of reasons why spectrum assignment is critical to achieving cheap, high quality mobile broadband. Additional spectrum is needed to expand access to broadband, improve the quality of service to those customers that already have access, and reduce the cost of access for all.

Consultation questions

3. Please comment on the above assessment of the status quo on broadband penetration in Sout Africa, and what role spectrum may play in addressing the gaps identified.
Comments:

3.3 KEY TRENDS

Technology can develop in unpredictable ways and so Ofcom has proposed a spectrum management plan for the 2020s, which includes a section on 'Contextual trends for future spectrum management'³⁴. There are a number of trends that Ofcom identifies that are relevant for long term planning in South Africa:

Changing external contexts

- Diversity of healthcare and wellbeing technologies such as wearable technology and medical devices, as well as increasing automation in the care for the aging and the disabled.
- Environmental concerns that will encourage the reduction of environmental impact through asset monitoring, smart utilities management or climate monitoring. Climate changes could also change how signals propagate, affecting the risk of interference between spectrum users.
- Safe and secure infrastructure will require greater use of wireless communications for remote monitoring and management of critical infrastructure sites and equipment.
- Long term implications of COVID-19 might mean increased home, flexible, or dispersed working requirements resulting in greater demands on connectivity in the home and rural areas.

Changing technology and network architectures

Katz (2012).

Page | 3-21 Consultation section

³³ Katz (2012).

 $^{^{34}~}See:~https://www.ofcom.org.uk/__data/assets/pdf_file/0027/208773/spectrum-strategy-consultation.pdf$

- Higher frequency bands that are not currently utilised will mean greater network speeds and capacity, improving consumer experiences. However, these spectrum bands have different propagation characteristics and so have different management requirements.
- Progression of radio technology will enable more efficiency in spectrum use, as well as more
 products and services having access the spectrum they need and when they need it.
- Deployment of increasingly localised telecoms infrastructure (e.g., to lampposts) will enable more
 devices, more data use, and quicker connectivity responses. This would lead to better resource
 utilisation but would also require very high-speed network connections.
- More stratospheric and satellite deployments could enable improved broadband internet in inaccessible locations.
- The retirement of analogue services in favour of newer digital ones.

Changing application demands

- Growing capacity demands for people and business and thus increasing quantities of data moving across networks e.g., increasing use of communications devices (particularly smart devices), and the importance of AI and data analytics.
- A shift towards wireless needing to have characteristics that match wired connections, allowing
 for increased complementarity between fixed and wireless services (product convergence and
 service substitution).
- Communication requirements of smart cities and industrial IoT will become more diverse.
- Robotics and drone usage becoming more common, including in industrial contexts requiring a combination of low latency, ultra-high reliability and high download and upload speeds.
- Connected vehicles becoming increasingly common, meaning more 'vehicle-to-everything' communication, such as traffic management services. Additionally, autonomous and semiautonomous vehicles will have various communication requirements.

Changing spectrum demands

The trends above, alongside future technological advancements, will support the greater adoption of wireless technologies throughout the economy and society. This continued adoption of digital technologies transforms businesses and organisations as they offer large gains in terms of productivity, cost reduction, sustainability and flexibility in responding to market changes.

These trends would lead to new wireless applications alongside changes in the provision of existing wireless services – leading to new spectrum demands that may look very different from that of today.

Growing use of higher frequencies

Radio technologies continue progressing and so much higher frequencies can be used, thus increasing the effective supply of usable spectrum. These higher frequency bands offer higher capacity and their propagation characteristics (limited range and the need for highly directional antennas) mean that there is a significantly different risk of interference compared to lower bands – in some ways easier to manage and in other ways harder. Notably, higher frequency bands are limited to short and variable ranges, meaning that they are not suitable for all applications. But at the same time, other technologies such as radar could make use of higher frequencies and wider bandwidths so as to provide high resolution imaging or sensing.

The move into these higher frequency bands may also create opportunities for new approaches to spectrum management - especially considering the larger capacity and fewer incumbents.

Other potentially disruptive technology developments

Technology developments could have a more disruptive impact on how spectrum is managed over time - for example, consider the role of automated tools that manage spectrum. There are also a number of prospective technologies that may offer a reduction in the need for spectrum use to be regulated to the

Page | 3-22 Consultation section

extent that it is today – for example, if devices had advanced capabilities to coordinate their use with others.

Looking at the number of other potential emerging technologies (AI, self-configuring networks, automated spectrum management tools, blockchain, spectrum in the 3000 GHz range and above, and 6G technology), it is too early to conclude definitively whether or not they will lead to disruptive changes for spectrum management within the next ten years. However, it is still important to work on understanding and developing relevant and new spectrum management technologies and techniques over time.

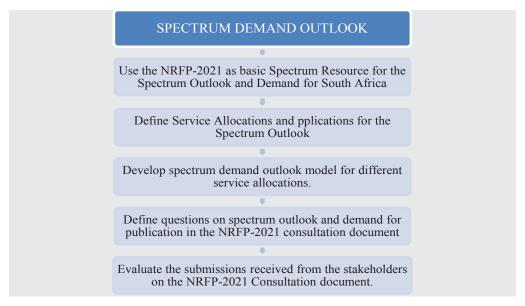

Consultation questions

Consultation questions
4. What future changes, if any, should ICASA examine with regard to the existing licensing regime to better plan for innovative new technologies and applications and allow for benefits that new technology can offer, such as improved spectrum efficiency?
Comment:
5. What future emerging technologies are to be taken into consideration and which technologies will have a significant impact? When are these technologies expected to become available?
Comment:
6. What and how will technology developments and/or usage trends aid in relieving traffic pressures? When are these technologies expected to become available?
Comment:
7. Are there any IoT applications that will have a large impact on the existing licence-exempt bands? If so, what bands will see the most impact from these applications?
Comment:

Page | 3-23 Consultation section

4 SPECTRUM DEMAND OUTLOOK

The basic workflow for the spectrum demand outlook includes the following steps:

The Authority has published the NRFP-2021, which is a key resource for developing the future spectrum outlook. The next step is to consider standard lists of applications for different radio services, discussed next. This is followed by considering the spectrum outlook for electronic communications network services (commercial fixed and mobile network services), and then the outlook for various specialised applications. Frequency migration and costing is then considered. Questions for consultation are set out throughout this document.

4.1 STANDARDISATION OF LISTS OF APPLICATIONS FOR DIFFERENT ITU RADIO SERVICES

It is important to assess spectrum demand against categories of services. The purpose of this section is to request comments on the standardisation of the applications that is applicable to the different ITU services in the Radio Regulations (RR). In the European Union, there is a list of service applications that provides a basis for analysis. All EU members maintain their databases and also provide input on the standard application being used in the region. The European Conference of Postal and Telecommunications Administrations (CEPT) maintains this database, called the European Communications Office (ECO) Frequency Information System (EFIS).

In South Africa and SADC there are no such standard list of applications for the different services applications, and this can cause confusion on what the associated application shall be called in the 3rd column of the NRFP-21.

The list of radio services in the ITU RR is divided into three layers of detail in accordance with the definitions given in the RR. When searching for and comparing information, EFIS makes use of these layers. For example, a search for a specific term in layer 2 will automatically start a search for all terms in layer 3 under that specific term. If nothing is found in either layer 2 or 3, EFIS also checks layer 1 and informs the user if an item is found.

It is important to define such a structure on applications for ICASA and South Africa, because:

• It will improve efficiency in the licensing system;

Page | 4-24 Consultation section

- It will provide a structured environment for categorisation of equipment that needs to be type approved; and
- It contributes to harmonisation of the frequency spectrum.

The following section describes the three layers of allocations:

Consultation questions

8. Please provide your views regarding the standardization of the naming of applications in the NRFP in accordance with CEPT ECC decision 1(03) approved 15 November 2001 and its subsequent revisions.
Comment:
9. What are your forecasts for data traffic and radio frequency spectrum needed over the next 5, 10 and 20 years for each of the EFIS application layers?
Comment:
10. How much spectrum is allocated to each of the EFIS application layers, and what is the economic value of spectrum used in each of the above EFIS application layers? What are the opportunity costs for current spectrum allocations for EFIS these application layers (what is the value to alternative users of these allocations)?
Comment:

4.2 SPECTRUM OUTLOOK FOR COMMERCIAL ELECTRONIC COMMUNICATIONS NETWORK SERVICES (FIXED, MOBILE, INCLUDING IMT)

As explained in Section 0, there is an emphasis in the ECA on spectrum allocations for electronic communications services, and electronic communications network services. As set out in the Authority's IMT roadmap³⁵, there are a range of applications for IMT that overlap with services allocated for more specialised services (discussed below in Section 4.3). The applications set out in the IMT roadmap are:

- (a) mobile telephony/broadband internet (LTE/IMT);
- (b) broadband access to scarcely populated areas;
- (c) services ancillary to broadcasting, which already coexist with broadcasting;
- (d) low power devices (licence exempt or not);
- (e) private mobile radio;
- (f) military communications; and

Page | 4-31 Consultation section

³⁵ See Government Gazette 42829.

(g) public protection and disaster relief (PPDR).

There is a considerable degree of overlap between the capabilities of mobile network technologies and services provided for specialised applications, and there is therefore a question as to what degree various specialised applications will simply use commercial mobile and fixed wireless technologies in future.³⁶

In the sections that follow, the demand for mobile internet services in the coming years is discussed first, in Section 4.2.1. Next, the outlook for spectrum used for fixed-wireless applications is described in Section 4.2.2.

4.2.1 MOBILE

The Authority's IMT roadmap considers the key applications for mobile in the coming years, and therefore provides a basis for the spectrum outlook for mobile service applications. The IMT roadmap reflects on the IMT 2020 vision set out by the ITU, which envisages:³⁷

- Enhanced mobile broadband (faster and more reliable broadband),
- Massive machine type communications, often overlapping with services offered by short-range devices (discussed in Section 4.3.10), and
- Ultra-reliable and low latency communications, such as for driverless cars and smart manufacturing.

The IMT roadmap 2019 documents that, historically, 460MHz of spectrum was assigned for IMT purposes. The previous IMT roadmap 2014 considered an additional 2x133MHz of paired spectrum and 290MHz of unpaired spectrum be made available, a total of 1016MHz. At the conclusion of the Authority's current spectrum auction, 1015MHz of spectrum will be assigned.³⁸

The need for IMT spectrum is likely to increase significantly in the coming years. This is for a number of reasons, according to the ITU (Figure 2, reflected in the Authority's IMT Roadmap):³⁹

- Enhanced mobile broadband applications serving consumers, including multi-media content, services and data.
- Ultra-reliable and low latency communications: applications such as wireless control of
 manufacturing facilities, remote medicine, transportation safety, etc have stringent latency,
 throughput and reliability requirements.
- 3. **Massive machine type communications:** there may be large numbers of low-usage devices with non-time-sensitive transmission requirements connected via mobile.

Figure 2: Usage scenarios for IMT-2020 and beyond

The main changes arising from IMT-2020 compared to IMT-Advanced are in respect of peak data rates, latency, mobility, connection density, energy efficiency, spectrum efficiency, and area traffic capacity (Figure 3). In short, users can expect to experience speeds of 100Mbps, spectrum efficiency is expected to improve three-fold, without an increase in energy use, very low latencies of 1ms over the air, and connection density up to $10^6/\mathrm{km}^2$.

Figure 3: Enhancement of key capabilities from IMT-Advanced to IMT-2020

It is also important to consider existing growth in mobile connections and usage in order to forecast future spectrum needed for IMT. In South Africa, the number of mobile connections has grown substantially over time, though growth has slowed in recent years (See Figure 4). The total number of connections of more than 100m in 2020 far exceeds the number of adults in South Africa (approximately 41.5m in 2019). Over the 16 years between 2004 and 2020, the number of connections grew by 10.5% per year. More recently, over the past 5 years, growth has slowed to approximately 4.8% per year.

Page | 4-33 Consultation section

2005 2006 2007 2008 2009 2010 2011 2012 2013 2014 2015 2016 2017 2018 2019 2020 ■ Vodacom ■ Cell C ■ MVNOs (incl Virgin) ■ Telkom ■ MTN

Figure 4: Mobile connections in South Africa – 2004-2020

Source: Operator annual results

Not only is the number of connections growing, but data usage per customer is increasing too. Telkom reports the total number of petabytes used by mobile customers on its network, which reached 942PB in 2020, growing at approximately 70% per year over the past 3 years (See Figure 5). Telkom's subscriber base has also grown over the past years, and so it is more important to calculate increase in usage per connection. Usage per connection has grown from 44GB per year (3.7GB per month) in 2017 to 69 GB in 2020 (5.7GB per month), at a rate of 16% per year.

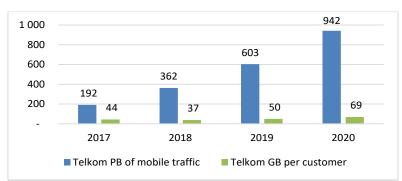

Figure 5: Growth in annual mobile data traffic on the Telkom network (2017-2020)

Source: Telkom annual reports

If we consider that MTN, Vodacom, Cell C and MVNOs have a similar traffic profile to Telkom, then mobile data usage in 2020 was in the region of 7,023 PB. If the number of connections grows as it has been for the past 5 years and average data usage per connection grows as it has for the past 3 years, then by 2030, 86,841PB will be used each year, and by 2040, 361,781 will be used (growth of approximately 22% per year). If instead the longer term subscription growth path is used, resulting in growth of 29% per year, then over 1m PB will be used by 2040. The ITU has also developed a range of scenarios for the period 2020-2030, the upper bound of which is growth of 55% per year, which if applied to South Africa, would result in consumption of 562PB per year by 2030.⁴¹

Page | 4-34 Consultation section

⁴¹ ITU-R, 'IMT traffic estimates for the years 2020 to 2030'. Report ITU-R M.2370-0, (07/2015).

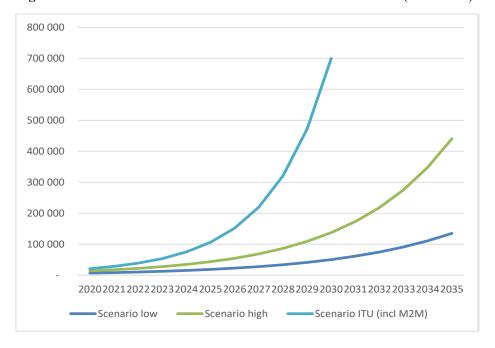

Figure 6: Growth scenarios in annual mobile data traffic for SA (2020-2040)

It may be that the number of connections, and usage, grows significantly in excess of current growth rates in South Africa, for the reasons discussed above. As a result, data usage may increase significantly in excess of current growth rates, due to the proliferation of connections, together with significant usage per connection. This suggests that mobile networks in South Africa may need to supply substantially higher volumes of data in future than are currently supplied, up to 80-fold more if one ITU scenario is used, by 2030.

As mentioned above, spectrum efficiency is expected to increase three-fold with the use of IMT-2020. Considering that mobile networks are currently at capacity with 609 MHz assigned to wireless broadband operators in sub-3.8GHz bands, then if there was no increase in network demand and site density remained the same, then only 203MHz would be needed to serve current needs. However, site density is anticipated to increase, reducing the need for spectrum, while at the same time volume demanded may grow up to 80-fold over the next 10 years, as mentioned above.

In 2013, the ITU estimated that up to 1,960MHz of spectrum would be needed for IMT in 2020, in respect of radio access technique groups (RATG) 1 and 2, which relate to pre-IMT systems and IMT-2000 and enhancements in the first group (RATG 1) and IMT – Advanced in the second group (RATG 2). Post-auction, the Authority anticipates licensing 1,015MHz (including to the Wholesale Open Access Network), as discussed above. Thus, spectrum assigned in South Africa will fall short of what was needed for IMT under the IMT-Advanced requirement.

Page | 4-35 Consultation section

⁴² These are explained more clearly in Methodology for calculation of spectrum requirements for the terrestrial component of International Mobile Telecommunications, Recommendation ITU-R M.1768-1 (04/2013).

Table 2: Total spectrum requirements for both RATG 1 and RATG 2 in the year 2020

	Total spectrum requirements for RATG 1	Total spectrum requirements for RATG 2	Total spectrum requirements RATGs 1 and 2
Lower user density settings	440 MHz	900 MHz	1 340 MHz
Higher user density settings	540 MHz	1 420 MHz	1 960 MHz

Source: ITU-R M.2290

Since then, the requirements for IMT-2020 have been developed, necessitating new estimates of demand. In Europe, for example, a report prepared for the GSMA estimates that an additional 1,000-2,000MHz of additional mid-band spectrum is needed to deliver speeds of 100Mbps downlink and 50Mbps uplink, similar to the speed targets set out in SA Connect discussed in Section 2.3, and consistent with the standards for IMT-2020 described above ⁴³ Thus, approximately double the sp

\mathbf{C}

ectrum currently planned for wireless broadband use needs to be considered for South Africa.
onsultation questions:
11. How should demand for commercial mobile services and IMT in the next few years be determined? What traffic model should be used in South Africa for traffic demand expectations? What are your comments on the spectrum requirements set out on Table 2Error! Reference source not found.? What are your views on using the Recommendation ITU-R M.1768-1 methodology to forecast IMT spectrum demand in South Africa? Please complete the input parameters in the attached spreadsheet for the market study information needed to apply the Recommendation ITU-R M.1768-1.
Comment:
12. Provide your support or reasons for objections on the bands being considered internationally for 5G commercial mobile allocations.
Comment:
13. Are the spectrum allocations comprehensive enough for spectrum demand projections for commercial mobile services in South Africa for the next 10 to 20 years?
Comment:

19. Provide your support or reasons for objections on the bands being considered internationally for 5G commercial mobile, fixed, satellite, or licence-exempt allocations.

Comment:

4.2.2 FIXED

Fixed services include high-capacity point to point wireless links that are required for a variety of networks (connectivity to mobile base stations to support mobile services, corporate networks and control networks for utilities). Ofcom's 'Technology Futures' report⁴⁵ recognizes that the underlying technologies in fixed networks and optical technologies will be impacted by complex multi-core and hollow-core fibre deployment techniques. Quantum based techniques will also have an impact in the near future, alongside denser and more complex integrated optical chips.

ITU data from 2019 shows that with internet use surpassing the 50 per cent mark (51.4 % globally by the end of 2019), fixed broadband subscription had grown to just over 15% (75% had a mobile

Page | 4-38 Consultation section

⁴⁴ See: https://www.itu.int/en/ITU-R/Documents/ITU-R-FAQ-IMT.pdf

⁴⁵ See: https://www.ofcom.org.uk/ data/assets/pdf file/0011/211115/report-emerging-technologies.pdf

broadband subscription)⁴⁶. Fixed broadband markets have shown some growth over the last four years, but Africa still has one of the lowest fixed broadband subscription rates in comparison with other regions. This is largely due to the absence of legacy infrastructure and the relatively lower costs of deploying wireless broadband infrastructure. The ITU estimates that the fixed broadband subscription rate for Africa was 0.5 per 100 inhabitants in 2020 - below the global average of 15.2 subscriptions per 100.⁴⁷ In South Africa, only 9.1% of households have internet access (Section 3.2). This suggests there is significant scope for use of wireless technologies for broadband at fixed locations in South Africa, including via 5G.

According to a 2018 BEREC⁴⁸ report, bands currently considered as 'pioneer bands' for 5G, are a mix of low, mid and high frequencies. Using a combination of these frequency bands is suggested - noting that spectrum in the mid frequency range (3400-3800 MHz) may be used to increase capacity for much in demand mobile services, but might also be used for fixed wireless access (FWA) and backhaul services. In the 3400-3800 MHz band it may become relevant to have coverage obligations (similar to 2600 MHz and 2100 MHz bands) with 5G-compatible quality requirements.

The availability of enough spectrum for mobile backhaul applications will be important for advanced mobile access operations as 5G systems develop and traffic grows, while the traditional fixed service bands for backhaul run out of capacity ⁴⁹.

The ITU proposed the consideration of a portfolio of wireless technologies for 5G backhaul in addition to fibre, to increase coverage. This would include point-to-multipoint (PMP), microwave and millimetre wave (mmWave) radio relays, high altitude platform systems (HAPS) and satellites.⁵⁰

There are also fibre-like services that may also need to be considered. For instance, the Facebook and Terragraph submissions to the Authority describe emerging applications that leverage the 60GHz band, including communication applications at multi-gigabit throughput, such as the Terragraph technology.⁵¹

4.3 SPECTRUM OUTLOOK DEMAND FOR SPECIALISED APPLICATIONS (AERONAUTICAL, BROADCAST, DEFENCE, MARITIME, ETC)

The specialised use of wireless communications or other specialised use of radio spectrum may be required for various applications by both the private and the public sector. Some of these applications are important for the delivery of key services, including for emergency service and defence. Examples of sectors and applications with long established requirements (and their future outlook demand) are outlined below:

4.3.1 AERONAUTICAL (INCLUDING RADIOLOCATION)

Spectrum is needed for specialised radio equipment used onboard aircraft, on the ground for communication with aircraft, and radars for air traffic control and navigation purposes.

The safety of current and future air navigation and traffic management systems is highly dependent on the availability of sufficient and protected (free from harmful interference) radio spectrum⁵². Looking towards technology improvements, high frequency range (3–30 MHz) becomes important for the provision of high availability services to aviation, including digital voice and data, in remote and oceanic areas⁵³.

Page | 4-41 Consultation section

⁵² See: https://www.itu.int/en/itunews/Documents/2019/2019-05/2019_ITUNews05-en.pdf

⁵³ See: https://www.itu.int/en/itunews/Documents/2019/2019-05/2019_ITUNews05-en.pdf

Additionally, low Earth orbit satellite relay of certain VHF frequencies in the aeronautical mobile (route) service in some remote and oceanic areas may be a very cost-effective way to improve air/ground pilot to controller communications⁵⁴.

Consultation question:

29. What will impact on the demand for these services/applications in the coming 10-20 years? What is the realistic demand for these services in the next 10 to 20 years? Are there adequate spectrum allocations for Aeronautical services in South Africa?

\sim						L	
U	()	m	m	e	n	L	

4.3.2 BROADCASTING

Ofcom's 'Technology Futures' report⁵⁵ recognizes that in the next 10 years it is expected that there will be significant developments in both television and radio broadcasting, live-streaming and on-demand media technology. Emerging media technologies will thus impact both the creation and production of media content and its distribution. Consumption will evolve too, such as optional graphics shown on screen and alternative audio options. In Europe, the use of 5G for content production is of considerable interest to major broadcasting. This could be the case in South Africa too as Emedia also notes in their submission that the future of broadcasting may be realised on developing technologies such as 5G⁵⁶. Furthermore, converged architecture such as Further evolved multimedia broadcast multicast service (FeMBMS) can use different broadcast transmitters and networks including 5G and DTT.

The ITU's 'Digital trends in Africa 2021'⁵⁷ research discusses the management and monitoring of the radio-frequency spectrum and transition to digital broadcasting, with Africa member states increasingly making the transition to digital terrestrial television broadcasting. In South Africa, the government has committed to digital migration, and the Authority published a plan to clear the 700MHz and 800MHz bands for IMT in 2020 following the digital migration.⁵⁸ However, new technology may not require this as EMedia notes in its submission that new technologies allow for broadcasting and IMT services to co-exist.⁵⁹

Digital audio broadcasting is currently used in the 235-267 MHz band and channel 13F is currently being used in the DAB+ trials. There is support for this band being permanently allocated for DAB+ use. In contrast 1452-1492MHz is no longer used for this purpose and can be reallocated. 3600-4200MHz is also used and suffering interference. There are trade-offs in the use of this band compared with for IMT services which need to be carefully considered.

⁵⁹ See Emedia submission par 20.

Additional spectrum in the 470MHz to 694MHz band is being studied for IMT services for region 1, in the 617-698MHz band, which may require broadcasters freeing up further spectrum for IMT.⁶⁰ At the same time, there are 4K and 8K broadcasting technologies that would require approximately 40Mbps in capacity.⁶¹ This is possible using the DVB-T2 technology adopted by South Africa, together with technologies such as High Efficiency Video Encoding (HEVC). It is therefore not clear that additional spectrum will be needed for terrestrial broadcasting services.

Consultation questions:

30.	What will impact on the demand for these services/applications in the coming 10-20 years? What is the realistic demand for these services in the next 10 to 20 years? Are there adequate spectrum allocations for Broadcasting services in South Africa?
Comme	ent:
31.	How much spectrum should be maintained for terrestrial broadcasting in the band 470MHz to 694MHz in the next 10 to 20 years?
Comme	ent:

4.3.3 DEFENCE SYSTEMS

Defence systems make use of a wide range of radio equipment in support of operations and training, including point to point communications, weapons calibration, airborne telemetry, radar and remotely controlled vehicles. This falls under the public service provisions by the government, who is a large spectrum user in general.

Government spectrum users, including for defence systems, usually operate within the same spectrum management framework as all other users. However, in order to recognise their unique needs and responsibilities, government spectrum sometimes requires specific regulatory arrangements⁶². In this sense, government users' access to spectrum can be categorised as either 'ordinary licensed' (on equal footing with other non-government users), or access under 'purpose-specific planning arrangements.

As a practical example of the latter, a portion of defence spectrum access could be licenced under the Defence apparatus⁶³. This can be issued in bands with certain footnotes ascribed - these footnoted bands are not the same as spectrum that defence accesses under (ordinary) non-Defence licences. In order to ensure that defence systems have ongoing access to the spectrum required for their key capabilities, the

Department of Defence needs to be regularly consulted. This dialog extends to situations where non-defence use may require the services of certain spectrum bands that are designated for defence systems.

In addition, it can be noted that several countries have arrangements in the 4940–4990 MHz band for defence and national security purposes. This is to support high-speed localised coverage around an incident or event - allowing public safety agencies to perform public safety activities and provide flexibility in deployment during emergency response and disaster recovery activities.

Consultation question:

32. What will impact on the demand for these services/applications in the coming 10-20 years' What is the realistic demand for these services in the next 10 to 20 years? Are there adequate spectrum allocations for Defence services in South Africa?
Comment:

4.3.4 MARITIME (INCLUDING RADIOLOCATION)

This includes specialized radio equipment required for communication between ships and with coast stations, for satellite, radar and beacons, and for navigation and the safety of shipping. In South Africa, Telkom offers maritime services.⁶⁴

Over the past few years, the International Maritime Organization (IMO) has put arrangements in place to facilitate the introduction of additional Global Maritime Distress and Safety System (GMDSS) mobile satellite service providers⁶⁵. This means that availability of the frequency bands to be used by recognized GMDSS satellite service providers (for the provision of GMDSS services) is important. In addition, increasing numbers of autonomous maritime radio devices that use AIS technology or digital selective calling (DSC) technology (or both) are being developed - altering the spectrum needs.

'The Radio Regulations'⁶⁶ by the ITU proposes that for maritime mobile service, the frequency 160.9 MHz may also be used for experimental use for future applications or systems (e.g., new automatic identification system (AIS) applications, man overboard systems, etc.).

Consultation question:

33. What will impact on the demand for these services/applications in the coming 10-20 years? What is the realistic demand for these services in the next 10 to 20 years? Are there adequate spectrum allocations for Maritime services in South Africa?
Comment:

 $^{^{66}~}See:~http://handle.itu.int/11.1002/pub/814b0c44-en$

Earth observation satellites collect data about the earth and atmosphere. This is used for applications such as weather forecasting, environmental monitoring, climate change research.

Consultation question:

34. What will impact on the demand for these services/applications in the coming 10-20 years? What is the realistic demand for these services in the next 10 to 20 years? Are there adequate spectrum allocations for Meteorological services in South Africa?

Comment:

4.3.6 PROGRAMME MAKING & SPECIAL EVENTS (PMSE)

These are wireless services such as cameras and microphones - used for news gathering, sports events, live concerts, films, theatre, religious, cultural and educational activities. This needs to include wireless services for both indoor and outdoor capacities.

Consultation question:

35. What will impact on the demand for these services/applications in the coming 10-20 years What is the realistic demand for these services in the next 10 to 20 years? Are there adequat spectrum allocations for PMSE services in South Africa?
Comment:

4.3.7 EMERGENCY SERVICES (INCLUDING PPDR)

In keeping citizens safe and providing rescue services, several radio technologies are important, including narrowband, wideband and broadband technologies.⁶⁷ It is important to recognise that commercial mobile networks are widely used for public protection and disaster recovery (PPDR) services, and so it is important to also consider spectrum for mobile services in this context (discussed above in Section 4.2.1). CRASA has recommended that spectrum for these services be harmonised across SADC countries, so as to achieve economies of scale in the region. This includes spectrum for narrowband, wideband and broadband services. CRASA also recommends adopting interoperable standards for PPDR, implementing the UN Tampere convention, and strengthening regional harmonisation processes.

Huawei points out the need for broadband as new services such as mobile video reporting from field locations, body worn cameras and drone cameras etc. require it. ⁶⁸

Page | 4-45

Consultation section

⁶⁷ CRASA 2019, 'Framework for Harmonisation of Radio Frequencies for Public Protection and Disaster Relief (PPDR)', available at: https://www.crasa.org/common_up/crasa-setup/18-04-2019_FRAMEWORK%20ON%20HARMONISATION%20OF%20FREQUENCIES%20FOR%20PPDR%20EDITION%202019.pdf

⁶⁸ See submission from Huawei dated 27 August 2021.

The result of not allocating specific portions of spectrum for PPDR related communications is that Public Sector bodies have to buy mobile broadband services from licenced commercial operators. ⁶⁹ This may be problematic because commercial services are not designed to cater for public sector PPDR needs and prices will be high as commercial operators need to make a profit on the portion of the spectrum allocated to them.

In an emergency these commercial networks are swamped by public traffic or otherwise be unavailable due to the effects of the emergency. Existing systems and frequency bands are only suitable for Narrow Band applications, which cannot be used for streaming video and other similar high-bandwidth applications. Deployment of mobile CCTV and video surveillance for crime prevention & community safety is restricted due to the high cost of commercial mobile broadband connections. At the same time, if mobile broadband prices fall in the coming years as more spectrum becomes available, it may be more feasible for this to be used for PPDR services.

⁶⁹ See submission from City of Cape Town dated 24 August 2021.

4.3.8 SATELLITE SYSTEMS

Satellite systems are not only used for satellite broadcasting and broadband for consumers, but also for a variety of specialised applications. These include connectivity to ships, aircraft, satellite news gathering and defence use. For instance, Viasat has recently established itself in South Africa, and offers a range of broadband services including via ESIM, for gate-to-gate aeronautical and pier-to-pier maritime services as well as for land-based mobile users, and for emergency response vehicles and buses and trains, as well as to the defence sector. ⁷⁰

Satellite systems are increasingly being used to deliver broadband services and are thus important in rural and remote areas, where access to internet is unreliable or unavailable, satellite internet is essential. With companies such as Starlink⁷¹ planning to expand their services to global coverage, it is expected that the spectrum allocated to satellite communications will need to increase. Furthermore, it is key to a world that has next-generation connectivity and 5G technology, as satellites enable the reach and capabilities of 5G technology to be maximised⁷².

Satellites also enable broadband connectivity to critical industries such as oil and gas, and mining⁷³ - with connections to Unmanned Aerial Vehicles (UAVs), for the IoT, driverless cars and buses being envisaged for the future. In addition, it is expected that the future of satellite systems will see experimentation and innovation through small satellite formations and virtual antennas, larger and more capable system, re-usable satellites, manufacturing in space, and studies into solar power in space.⁷⁴ Thus, without adequate spectrum, the satellite communication industry will neither be able to maintain and grow its 5G services or connect the unconnected.

At the same time, the ITU recognizes the spectrum requirements of International Mobile Telecommunications (IMT) in accommodating future user requirements and network deployments. This means that there is a challenge to identify spectrum for IMT while at the same time ensuring continued access to spectrum by other technologies, including satellite⁷⁵. The costs and benefits of alternative use cases need to be considered in individual bands. For instance, in Eutelsat and ESOA's submissions to the Authority, concerns are raised about references to IMT services in the 4500-4800MHz band in the draft NRFP 2021. FesoA's submission explains that tens of billions of dollars have been spent on deploying satellite capacity using the 28GHz band. These alternative uses need to be carefully understood, and stakeholders are requested to comment on the costs and benefits of alternative uses in Section 5.

Traditionally, spectrum was exclusively allocated to mobile operators but due to the increasing demand, sharing can provide a way to make the use of existing spectrum more efficient⁷⁷. However, stakeholders such as Sentech have identified interference where sharing arrangements are in place, incurring costs

4.3.9 RADIO ASTRONOMY (INCLUDING SPACE SCIENCE)

This includes radio astronomy and space research – contributing to the knowledge of the universe. Additionally, space science provides information about space weather (needed to reduce the risks to infrastructure from solar activity).

At a recent meeting of the Space Frequency Coordination Group (SFCG), various plans for lunar exploration were discussed - access to and protection of the radio spectrum for these uses is thus important in order to understand the future of the planet and for space exploration⁷⁹.

'The Radio Regulations'⁸⁰ by the ITU considers the needs of the Earth exploration-satellite (passive) and space research (passive) services important in any future planning of the bands 6 425-7 075 MHz and 7 075-7 250 MHz. Other advancements that have become of interest for some include: a possible

Page | 4-48 Consultation section

⁷⁸ See submission from Sentech dated 27 August 2021.

⁷⁹ See: https://www.itu.int/en/itunews/Documents/2019/2019-05/2019 ITUNews05-en.pdf

⁸⁰ See: http://handle.itu.int/11.1002/pub/814b0c44-en

new allocation for the Earth exploration-satellite service in 22.55–23.15 GHz; radiocommunications for sub-orbital vehicles; a possible upgrade of the allocation of the band 14.8–15.35 GHz to the space research service; and, the consideration of possible adjustments to passive remote sensing allocations between 231.5 and 252 GHz.

In addition, according to the 2020 Edition of 'The Radio Regulations' ⁸¹ by the ITU, all practicable protection in the band 1 660.5-1 668.4 MHz should be allocated for future research in radio astronomy. In particular, by the removal of air-to-ground transmissions in the meteorological aids service in this band.

Furthermore, exploratory space weather observations and study of the solar-terrestrial relationships have started to become more operational in nature, as countries increasingly monitor the impact that solar flares and geomagnetic storms may have on life and Earth. This means that it is important to consider regulation of this aspect of space science⁸².

According to the ITU, recent advances in microwave technology mean that the use of frequencies above 275 GHz by active services for communications (and other uses) is possible⁸³. The use of frequencies above 275 GHz creates future opportunities for land-mobile and fixed service applications. With the technological development of active services above 275 GHz still being relatively new, further studies are required to facilitate the use of frequencies above 275 GHz by all service applications - including the need to protect the Earth exploration satellite service (EESS) (passive) and radio astronomy applications.

Consultation question:

42. What will impact on the demand for these services/applications in the coming 10-20 years? What is the realistic demand for these services in the next 10 to 20 years? Are there adequate spectrum allocations for Astronomy services in South Africa?

Comment:

4.3.10 SHORT-RANGE DEVICES84

Short-range devices (SRDs) offer a wide variety of capabilities, from active medical implants, to alarms, and radio frequency identification devices RFID). SRDs are continuously evolving and some SRDs (including RFIDs and certain types of medical devices) have great growth potential, meaning they may benefit from higher levels of harmonization - for example, consider tuning ranges.

The ITU considers harmonisation of spectrum usage as imperative for the efficiency of SRDs. This is to accommodate the growth and cross border expansion of SRDs as well as Ultra-Wide Band (UWB) - allowing for high data throughput for communications, high-resolution location and imaging devices⁸⁵. In addition, SRDs are increasingly playing a role in the mobile Internet economy, mobile broadband applications and IoT.

⁸² See: https://www.itu.int/en/itunews/Documents/2019/2019-05/2019 ITUNews05-en.pdf

⁸³ See: https://www.itu.int/en/itunews/Documents/2019/2019-05/2019 ITUNews05-en.pdf

⁸⁴ See: http://www.itu.int/dms/pub/itu-r/opb/vadm/R-VADM-RES-2019-PDF-E.pdf

⁸⁵ See: https://www.eenewsembedded.com/news/itu-addresses-challenges-expanding-use-short-range-radio-devices

In general, SRDs use frequency bands that are already allocated to radiocommunication services, including frequency bands designated for the deployment of industrial, scientific and medical (ISM) applications. SRD operation should thus be situated in suitable harmonized frequency bands, in order to reduce harmful interference from SRDs to radiocommunication services. The trend therefore is to increase the use of advanced spectrum access and interference mitigation technologies.

The Authority also received a submission from ADC Automotive Distance Control Systems GmbH, indicating that short-range devices will also be used in the vehicle industry in future, including:⁸⁶

- 57-64GHz: this band is to be used for in-cabin sensing including in order to detect whether a child has been left behind in a car, part of the EURO-NCAP 2025;
- 77-81GHz: to be used for new vehicle radar applications, which will require a higher number of sensors and a 360 degree view.

This suggests that considerable additional spectrum may be needed for short-range devices in the coming years in South Africa.

Consultation question:

43. What will impact on the demand for these services/applications in the coming 10-20 years? What is the realistic demand for these services in the next 10 to 20 years? Are there adequate spectrum allocations for Short-range services in South Africa?
omment:

4.3.11 OTHER87

C

There are a range of other service applications for spectrum. For instance, amateur radio enables participants to experiment with and learn about radio, as well as being able to communicate with other radio amateurs around the world. Business radio provides both narrowband and wideband communications for applications including utilities, transport operators, hospitals, industrial sites and taxi firms.

The ITU recognises the importance of maintaining the existing spectrum access for amateurs (in particular when providing communications in disaster situations and for relief operations), as well as strengthening protections for radiocommunication services against interference from other current or future generators of radio frequency (RF) energy – for example, wireless power transmission for electric vehicles involves very large amounts of RF power⁸⁸.

In addition, there are increasing opportunities for businesses and organisations to benefit from wireless communications (including public sector users who rely on the predictability and quality of spectrum).

Wireless connections are enabling digital transformation objectives to be met in many industries - including utilities, agriculture, logistics and transport. Some new users and applications will have specialised requirements – for example, high reliability communications for critical infrastructure, low

.

⁸⁶ See submission from ADC Automotive Distance Control Systems GmbH dated 26 August 2021.

⁸⁷ See: https://www.ofcom.org.uk/ data/assets/pdf file/0027/208773/spectrum-strategy-consultation.pdf

⁸⁸ See: https://www.itu.int/en/itunews/Documents/2019/2019-05/2019 ITUNews05-en.pdf

latency communications for manufacturing, low cost / delay-tolerant sensors for smart cities and agritech.

Some new applications will be supported by public mobile networks services, and wireless technology developments (5G and evolving LTE and Wi-Fi technology). However, other users and applications will have requirements that need other technologies and / or network models.

In 2017, Ofcom⁸⁹ proposed the use of spectrum in the 700 MHz, 3.4 GHz and 24 GHz bands for 5G use. Ofcom has also proposed to change the authorization regime in the 64–66 GHz band to licence-exempt and expand the use cases for the 57–66 GHz band. But it is important to note that work done by the ITU demonstrated that 5G can be used safely alongside other services, including weather sensing services, commercial satellite services, radar and others⁹⁰.

Consultation questions

44. Which vertical markets will require most secured licensed spectrum to overcome their current interference and congestion issues?
Comment:
45. How much will spectrum management and orderly frequency planning improve the interference situations in certain frequency bands?
Comment:

4.4 FREQUENCY BANDS CONSIDERED IN SPECTRUM OUTLOOK STUDIES IN OTHER COUNTRIES.

We have studied spectrum outlook and demand studies that were performed recently in countries situated in Region's 1, 2 and 3 around the world. This provides a benchmark for short term studies for spectrum outlook for up to five years. The ICASA long term study obviously are looking at more comprehensive requirements for up to 20 years. The table included below indicates the frequency bands which were consider in the studies undertaken for the following countries:

- New Zealand
- Australia
- Canada
- United Kingdom

The information below was extracted from the international spectrum outlook studies in the mentioned countries, can be considered in the ICASA long term Spectrum outlook study.

4.5 BANDWIDTH AVAILABILITY IN DRAFT NRFP-21

We produced an extraction from the Draft NRFP 21 (see Annexure A) that summarise the available bandwidth per band allocation as included in the NRFP. This extraction does not distinguish between the primary allocations in a specific frequency sub-band where such band is shared or not. We do not have RFSAP's for all frequency bands and included references for the available RFSAP's.

We propose that the document in annexure A can be used to look at the total available spectrum that is shared between the primary allocations in the sub-band. It also summarise or calculate the total available frequency spectrum (unweighted between the different service allocations) for background information.

We did not distinguish between satellite services e.g. space-to-earth and earth-to-space as well as other pairing information.

The listed service allocation categories can be used to estimate the future requirement for each service allocation.

Consultation questions

46.	Please provide input on future spectrum requirements for the different service allocations as well as the urgency for such additional frequency allocations for such a service.
Comme	ent:
47.	Which Service allocations require RFSAP's and for which frequency bands. Also specify the urgency for the creation of such RFSAP's.
Comme	ent:

4.6 TASKS FLOWING FROM THE COMMENTS ON THE DRAFT NRFP-21 RELATING TO SPECTRUM OUTLOOK.

The publication of the draft NRFP-21 for comments and the feedback received from the stakeholders forms a valuable source for frequency outlook and demand for the next number of years. The information received during such a process are extremely valuable and assists the Regulatory Authority in preparation of the next WRC as well as the future trends in spectrum demand amongst the different service allocation categories. It also informs the stakeholders of the typical service applications that will be in demand for the future.

The specific comments received on the different frequency bands provide some indication of the spectrum demand for the band and will also pave the way to the future developments in the different industries. This set of information received during the consultation process can benefit South Africa in engineering, economic and socio economic studies and can act as a stimulus to the Universities for post graduate studies.

In the regulatory environment the following additional tasks will be generated:

- Radio Frequency Spectrum Assignment Plans
- Interference Mitigation Procedures
- Frequency Band Sharing Techniques
- Transmission Technology Studies
- Equipment demand studies

Page | 4-53 Consultation section

- Manufacturing and assembly opportunities
- Radiation safety studies
- Economic impact studies
- Technology comparative studies
- Radiation level increase studies
- Technology life cycle studies
- Mathematical models for bandwidth demand

All of the above and more can assist ICASA and the Ministry to predict the spectrum outlook and demand in a scientific way.

All the submissions received on the Draft NRFP-21 is available in the public domain and can ensure that spectrum outlook and demand become a year to year update exercise.

The above also demonstrate that the update of the NRFP on a 3 to 4 year period, following the WRC, is and exercise that requires much more preparation in order to ensure that the communication industry and the South African economy is stimulated.

Consultation questions

48	. Please provide your organisations strategy and suggestions on how the Authority can ensure that spectrum outlook and demand studies can contribute to stimulation of the South African economy.
Comm	ent:

Page | 4-54 Consultation section

5 FREQUENCY MIGRATION AND COSTING

Frequency migration from one frequency band to another remains one of the most challenging tasks in Spectrum Management. The reasons for the migration can include numerous reasons which include:

- Migration from analogue to digital
- Temporary agreements to overcome a specific problem at a time.
- International pressure to clear frequency bands for e.g. IMT.
- Migration from one technology to another due to spectrum efficiency.
- Obsolete equipment which requires a new technology in another frequency band.

The challenges for the regulator and licensees in respect of migration are significant. Shortage of resources and resistance to change are some of the aspects that hamper the migration process. The government departments in South Africa together with other private companies are important stakeholders in this area. No budgeting or insufficient budgeting is performed for this large expense due to various reasons. Money is required for other more important expenses which leaves the regulator stranded. Any company that does not have an engineering team will underestimate the cost. The factors that contribute to the migration problems include the following:

- Complexity of migration
- Dual illumination period
- Compilation of fleet maps
- Interruption to the operation of the company
- Installation of the radios into the vehicles
- Training of installation technicians and all other users
- Complex tender processes for equipment purchasing, installation, commissioning.
- Complex maintenance procedures
- Duplication of operational cost during the dual illumination period
- Poor network coverage and capacity planning especially if the conversion is from analogue to digital

The total cost of such a frequency migration can run into billions of Rands. Licensees may already be incurring costs in relation to changes in spectrum use over time, and it is important for the Authority to understand the nature of these costs, and the related benefits of any changes in use. For instance, in Sentech's submission to the Authority on the NRFP 2021, Sentech refers to a range of costs it has incurred in managing interference in the 3.4-4.2GHz band.⁹¹ It is therefore important that the Authority briefs all licence holders and especially government entities of the importance of migration and also the cost and manpower involvement.

Frequency migration problems can drastically affect the spectrum outlook projections for the medium and long term. The frequency migration targets were defined in the Authority's frequency migration plans.

Consultation questions:

Consultation section

⁹¹ See submission from Sentech dated 27 August 2021.

49. The spectrum outlook described above in Section 4, and in particular the substantial
additional requirements for IMT and fixed-wireless spectrum, suggest that a number of
additional bands will need to be assigned for the purposes of internet access, and incumbent
users will need to be migrated out of the bands mentioned in the list on Table 3 and on any
bands your organisation suggests on Table 4. What are the costs of migrating these users so
that radio frequency spectrum is allocated to its highest value use?

\mathbf{C}	വ	m	m	er	۱t:

50.	What would the costs of freeing up spectrum for commercial fixed and mobile use be
	(considering the bands mentioned above on Table 3 and Table 4)? What would the economic
	benefits of doing so be, in respect of increase consumer surplus, and increased producer
	surplus?

Comment:

51. Assuming that South Africa follows the ITU's recommendations to assign up to 1,940MHz of spectrum for IMT-2000 and IMT-advanced services, and that South Africa follows trends in Europe for potentially another 2,000 MHz of spectrum for IMT-2020, what would the costs of freeing up the various spectrum bands be? In this regard, please refer to Table 3 and Table 4, as explained above.

Comment:

Page | 5-56 Consultation section

6 SPECTRUM SHARING

As the demand for spectrum increases and frequency bands become more congested especially in densely populated urban centres, spectrum managers are following diverse approaches to sharing frequencies. This can include:

- Using of administrative methods including in-band sharing,
- Licensing such as leasing and spectrum trading,
- and the unlicensed spectrum commons combined with the use of low power radios or advanced radio technologies including ultra-wideband and multi-modal radios,

In the rest of this section, we expand on spectrum sharing and the methods that can be applied.

6.1 SPECTRUM SHARING

Spectrum sharing can be implemented using any of the following principles:

- Frequency Separation: e.g. different carrier frequencies, hence used bandwidths do not overlap each other –
- Spatial Separation: e.g. servicing different areas so they do not overlap each other —
- Time Separation: transmitting at different time –
- Signal Separation: different signal code, allowing to separate each other at the reception Those separations can be
 - Steady: regulatory framework –
 - Dynamic (changing in short time) technical standards and management

The above techniques of spectrum sharing can be explained into more detail as described in Rec. ITU-R SM.1132-2 (10/2001):

6.1.1 FREQUENCY SEPARATION

Frequency separation can be achieved using any of the following techniques:

- 1. Channel plans
- 2. Band segmentation
- 3. Frequency agile systems
- 4. Dynamic sharing:
 - a. Dynamic real-time frequency assignment
 - b. Frequency division multiple access (FDMA)
 - c. Control of emission
 - d. Spectrum characteristics
 - e. Dynamic variable partitioning
 - f. Frequency tolerance limitation
 - g. Demand assignment multiple access (DAMA)
 - h. Frequency diversity

6.1.2 TIME SEPARATION

Time separation: can be achieved using any of the following techniques:

Page | 6-57 Consultation section

- 1. Duty cycle control
- 2. Dynamic real-time frequency assignment
- 3. Time division multiple access (TDMA)

6.1.3 SIGNAL SEPARATION

Signal separation: can be achieved using any of the following techniques:

- 1. Signal coding and processing
- 2. Forward error correction (FEC)
- 3. Interference rejection
- 4. Code division multiple access (CDMA):
 - a. Spread spectrum
 - b. Direct sequence
 - c. Frequency hopping
 - d. Pulsed FM
- 5. Interference power/bandwidth adjustments:
 - a. Co-channel
 - b. Dynamic transmitter level control
 - c. Power flux density (pfd) limitation and spectral power flux density (spfd) limitation (energy dispersal)
- 6. Modulation complexity
- 7. Coded modulation
- 8. Adaptive signal processing
- 9. Antenna polarization

6.1.4 Licensed Shared Access (LSA) (Report ITU-R SM.2404-0 (06/2017)

License spectrum sharing holds the potential to:

- Improving the overall efficiency and effectiveness of spectrum use;
- Improve the quality of providing telecommunication services;
- Promoting economies of scale and encouraging investments;
- Exploiting temporal and geographical dimensions by allowing users to access a particular piece of spectrum for a defined time period or in a defined area to increase the utilization of spectrum.

Licensed Shared Access is a regulatory approach aiming to facilitate the introduction of radiocommunication systems operated by a limited number of licensees under an individual licensing regime in a frequency band already assigned or expected to be assigned to one or more incumbent users.

Under the Licensed Shared Access (LSA) approach, the additional users are authorized to use the spectrum (or part of the spectrum) in accordance with sharing rules included in their rights of use of spectrum, thereby allowing all the authorized users, including incumbents, to provide a certain QoS"

Page | 6-58 Consultation section

6.1.4.1 Key features of the LSA approach

- 1. A "sharing framework", for a given frequency band, will define the spectrum, with corresponding technical and operational conditions, that can be made available for alternative usage under LSA framework.
- 2. Establishing a "sharing framework" is under the responsibility of the RA and requires the involvement of all relevant stakeholders.
- 3. The NRA sets the "sharing framework" procedures for individual authorisations to LSA users and a set of "sharing rules" or "sharing conditions.
- 4. The "sharing framework" will materialize the change, if any, in the spectrum rights of the incumbent(s) and define the spectrum, with corresponding technical and operational conditions, that can be made available for alternative usage under LSA.
- 5. LSA excludes concepts such as "opportunistic spectrum access", "secondary use" or "secondary service" where the applicant has no protection from primary user.

Consultation questions

52. Due to the scarcity of high demand spectrum and the consequential fact that Spectrum Sharing in certain bands are non-negotiable, how shall you describe the best sharing conditions for the South African scenario?
Comment:

6.2 GENERAL COMMENTS ON SPECTRUM SHARING APPROACHES

The following comments on spectrum sharing are also applicable and additional options for consideration when spectrum sharing is applied.

Sharing can have different approaches:

- regulatory or a technology approach
- international or national levels

Sharing can be among:

- different radio communication services or applications
- different entities or type of users e.g. governmental vs commercial use
- different licensed users of the same/similar application (e.g. PMR services, Point to point links)
- protected primary users and licence-exempt users (e.g. radars and EESS vs 5 GHz RLANs);
- different licence-exempt users

In respect of the latter group, it is important to note for example that GH Communications documented in its submission to the Authority that the African Telecommunications Union recommended allocating the band 5925-6425MHz (lower 6GHz band) to licence exempt use. Facebook explained in its submission that this additional 500MHz of licence exempt spectrum is needed because the 2.4GHz and 5GHz Wi-Fi bands are becoming congested, limiting the possibilities for what fibre broadband can

Page | 6-59 Consultation section

_

⁹² See submission from GH Communications, dated 26 August 2021.

achieve, since this is typically distributed over Wi-Fi in homes and offices.⁹³ In addition, Wi-Fi is increasingly being used for telehealth, remote learning, and remote work. It is therefore important to consider the costs and benefits of using additional bands for licence free use.

6.3 ALTERNATIVE SPECTRUM SHARING SCENARIOS

A number of scenarios can be considered in respect of the spectrum outlook for South Africa. An important consideration when projecting spectrum allocations in the coming 10-20 years is the assignment of spectrum for electronic communications and electronic communications network services, as required in the Act. This is not least due to the convergence of a range of services and applications that increasingly rely on commercial mobile and fixed wireless networks, particularly in SADC countries.

In order to achieve this overarching objective, there are three key scenarios that might be discussed:

- Broadband delivery scenario: this involves adding at least another 2000MHz for wireless broadband services, whether WRC has allocated them to IMT or not, to the currently planned 1015MHz IMT assignments, including by means of shared and licence free spectrum assignments;
- Mixed broadband and traditional services: this envisage a steady approach to changing allocations, anticipating but not necessarily waiting for WRC processes to be finalised; and
- Low broadband scenario, essentially adding incrementally to the status quo.

Consultation questions

53. Due to the convergence of technologies and the changes in regulatory licensing environment do you believe that certain service allocations categories will or need to change?
Comment:
54. What existing licence-exempt frequency bands will see the most evolution in the next five years?
Comment:

55. How much spectrum, and in which bands, should be made available for licence-exempt purposes (such as Wi-Fi) over the 5, 10 and 20 years? What would the costs of freeing up these bands for IMT be? What would the economic benefits of doing so be, in respect of increase consumer surplus, and increased producer surplus? Which vertical markets will require most secured licensed spectrum to overcome their current interference and congestion issues?

Page | 6-60 Consultation section

⁹³ See submission from Facebook, dated 27 August 2021.

Comment:
56. How much spectrum, and in which bands, should be made available for dynamic spectrum access over the next 5, 10 and 20 years? What would the costs of freeing up these bands for IMT be? What would the economic benefits of doing so be, in respect of increase consumer surplus, and increased producer surplus?
Comment:
57. What existing licence-exempt frequency bands will see the most evolution in the next five years?
Comment:
58. Are there any IoT applications that will have a large impact on the existing licence-exempt bands? If so, what bands will see the most impact from these applications?
Comment:
59. Will the trend for offering carrier-grade or managed Wi-Fi services continue to increase over the next five years? If so, will this impact congestion in Wi-Fi bands and which bands would be most affected?
Comment:
60. Are there specific frequency bands that will be in higher demand over the next 10 to 20 years and do you expect higher demands for spectrum in these frequency bands in South Africa? Are there any other frequency bands that should be considered for release in the next 10 to 20 years for commercial mobile, fixed, satellite, or licence-exempt that are not discussed above? Provide motivations for your proposal.
Comment:

8 APPENDIX B: TERMS, DEFINITIONS AND ACRONYMS

8.1 TERMS AND DEFINITIONS

These definitions are for the purposes of the NRFP and do not necessarily apply elsewhere.

adaptive system:	A radiocommunication system which varies its radio characteristics according to channel quality.
administration	Any governmental department or service responsible for discharging the obligations undertaken in the Constitution of the International Telecommunication Union, in the Convention of the International Telecommunication Union and in the Administrative Regulations (CS 1002).
allocation (of a frequency band)	Entry in the Table of Frequency Allocations of a given frequency band for the purpose of its use by one or more terrestrial or space radiocommunication services or the radio astronomy service under specified conditions. This term shall also be applied to the frequency band concerned.
allotment (of a radio frequency or radio frequency channel)	Entry of a designated frequency channel in an agreed plan, adopted by a competent conference, for use by one or more administrations for a terrestrial or space radiocommunication service in one or more identified countries or geographical areas and under specified conditions.
assignment (of a radio frequency or radio frequency channel)	Authorization given by an administration for a radio station to use a radio frequency or radio frequency channel under specified conditions.
aeronautical earth station:	An earth station in the fixed-satellite service, or, in some cases, in the aeronautical mobile-satellite service, located at a specified fixed point on land to provide a feeder link for the aeronautical mobile-satellite service.
aeronautical mobile (OR)** service:	An <i>aeronautical mobile service</i> intended for communications, including those relating to flight coordination, primarily outside national or international civil air routes.
aeronautical mobile $(R)^*$ service:	An <i>aeronautical mobile service</i> reserved for communications relating to safety and regularity of flight, primarily along national or international civil air routes.
aeronautical mobile service:	A mobile service between aeronautical stations and aircraft stations, or between aircraft stations, in which survival craft stations may participate;

Page | 8-133

^{** (}OR): off-route.

^{* (}R): route.

	emergency position-indicating radiobeacon stations may also participate in this service on designated distress and emergency frequencies.
aeronautical mobile satellite (OR)** service:	An <i>aeronautical mobile-satellite service</i> intended for communications, including those relating to flight coordination, primarily outside national and international civil air routes.
aeronautical mobile satellite (R)* service:	An <i>aeronautical mobile-satellite service</i> reserved for communications relating to safety and regularity of flights, primarily along national or international civil air routes.
aeronautical mobile- satellite service:	A mobile-satellite service in which mobile earth stations are located on board aircraft; survival craft stations and emergency position-indicating radiobeacon stations may also participate in this service.
aeronautical radionavigation service:	A radionavigation service intended for the benefit and for the safe operation of aircraft.
aeronautical radionavigation- satellite service:	A radionavigation-satellite service in which earth stations are located on board aircraft.
aeronautical station:	A land station in the aeronautical mobile service.
	In certain instances, an aeronautical station may be located, for example, on board ship or on a platform at sea.
aircraft earth station:	A mobile earth station in the aeronautical mobile-satellite service located on board an aircraft.
aircraft station:	A mobile station in the aeronautical mobile service, other than a survival craft station, located on board an aircraft.
amateur service:	A radiocommunication service for the purpose of self-training, intercommunication and technical investigations carried out by amateurs; that is, by duly authorized persons interested in radio technique solely with a personal aim and without pecuniary interest.
amateur station:	A station in the amateur service.
amateur-satellite service:	A radiocommunication service using space stations on earth satellites for the same purposes as those of the amateur service.
base earth station:	An earth station in the fixed-satellite service or, in some cases, in the land mobile-satellite service, located at a specified fixed point or within a specified area on land to provide a feeder link for the land mobile-satellite service.
base station:	A land station in the land mobile service.

Page | 8-134

broadcasting service:	A <i>radiocommunication service</i> in which the transmissions are intended for direct reception by the general public. This service may include sound transmissions, <i>television</i> transmissions or other types of transmission (CS).
broadcasting station:	A station in the broadcasting service.
broadcasting-satellite service:	A radiocommunication service in which signals transmitted or retransmitted by space stations are intended for direct reception by the general public.
	In the broadcasting-satellite service, the term "direct reception" shall encompass both <i>individual reception</i> and <i>community reception</i> .
coast earth station:	An earth station in the fixed-satellite service or, in some cases, in the maritime mobile-satellite service, located at a specified fixed point on land to provide a feeder link for the maritime mobile-satellite service.
coast station:	A land station in the maritime mobile service.
Coordinated Universal Time (UTC):	Time scale, based on the second (SI), as described in Resolution 655 (WRC-15). (WRC-15). For most practical purposes associated with the Radio Regulations, UTC is equivalent to mean solar time at the prime meridian (0° longitude), formerly expressed in GMT.
Earth exploration- satellite service:	A radiocommunication service between earth stations and one or more space stations, which may include links between space stations, in which: — information relating to the characteristics of the Earth and its natural phenomena, including data relating to the state of the environment, is obtained from active sensors or passive sensors on Earth satellites.
	- similar information is collected from airborne or Earth-based platforms;
	- such information may be distributed to earth stations within the system concerned;
	 platform interrogation may be included.
	This service may also include <i>feeder links</i> necessary for its operation.
earth station:	A <i>station</i> located either on the Earth's surface or within the major portion of the Earth's atmosphere and intended for communication:
	- with one or more <i>space stations</i> ; or
	 with one or more stations of the same kind by means of one or more reflecting satellites or other objects in space.
emergency position- indicating radiobeacon station:	A <i>station</i> in the <i>mobile service</i> the <i>emissions</i> of which are intended to facilitate search and rescue operations.

experimental station:	A <i>station</i> utilizing <i>radio waves</i> in experiments with a view to the development of science or technique. This definition does not include <i>amateur stations</i> .
facsimile	A form of telegraphy for the transmission of fixed images, with or without half-tones, with a view to their reproduction in a permanent form.
feeder link:	A radio link from an <i>earth station</i> at a given location to a <i>space station</i> , or vice versa, conveying information for a <i>space radiocommunication service</i> other than for the <i>fixed-satellite service</i> . The given location may be at a specified fixed point, or at any fixed point within specified areas.
fixed service:	A radiocommunication service between specified fixed points.
fixed station:	A station in the fixed service.
fixed-satellite service:	A radiocommunication service between earth stations at given positions, when one or more satellites are used; the given position may be a specified fixed point or any fixed point within specified areas; in some cases, this service includes satellite-to-satellite links, which may also be operated in the inter-satellite service; the fixed-satellite service may also include feeder links for other space radiocommunication services.
frequency-shift telegraphy	Telegraphy by frequency modulation in which the telegraph signal shifts the frequency of the carrier between predetermined values.
high altitude platform station:	A station located on an object at an altitude of 20 to 50 km and at a specified, nominal, fixed point relative to the Earth.
industrial, scientific and medical (ISM) applications (of radio frequency energy):	Operation of equipment or appliances designed to generate and use locally radio frequency energy for industrial, scientific, medical, domestic or similar purposes, excluding applications in the field of <i>telecommunications</i> .
instrument landing system (ILS):	A <i>radionavigation</i> system which provides aircraft with horizontal and vertical guidance just before and during landing and, at certain fixed points, indicates the distance to the reference point of landing.
instrument landing system glide path:	A system of vertical guidance embodied in the <i>instrument landing system</i> which indicates the vertical deviation of the aircraft from its optimum path of descent.
instrument landing system localizer:	A system of horizontal guidance embodied in the <i>instrument landing system</i> which indicates the horizontal deviation of the aircraft from its optimum path of descent along the axis of the runway.
inter-satellite service:	A radiocommunication service providing links between artificial satellites.
land earth station:	An earth station in the fixed-satellite service or, in some cases, in the mobile-satellite service, located at a specified fixed point or within a specified area on land to provide a feeder link for the mobile-satellite service.
land mobile earth station:	A <i>mobile earth station</i> in the <i>land mobile-satellite service</i> capable of surface movement within the geographical limits of a country or continent.

Page | 8-136

land mobile service:	A mobile service between base stations and land mobile stations, or between land mobile stations.
land mobile station:	A <i>mobile station</i> in the <i>land mobile service</i> capable of surface movement within the geographical limits of a country or continent.
land mobile-satellite service:	A mobile-satellite service in which mobile earth stations are located on land.
land station:	A <i>station</i> in the <i>mobile service</i> not intended to be used while in motion.
maritime mobile service:	A mobile service between coast stations and ship stations, or between ship stations, or between associated on-board communication stations; survival craft stations and emergency position-indicating radiobeacon stations may also participate in this service.
maritime mobile- satellite service:	A mobile-satellite service in which mobile earth stations are located on board ships; survival craft stations and emergency position-indicating radiobeacon stations may also participate in this service.
maritime radionavigation service:	A radionavigation service intended for the benefit and for the safe operation of ships.
maritime radionavigation- satellite service:	A radionavigation-satellite service in which earth stations are located on board ships.
marker beacon:	A transmitter in the <i>aeronautical radionavigation service</i> which radiates vertically a distinctive pattern for providing position information to aircraft.
meteorological aids service:	A <i>radiocommunication service</i> used for meteorological, including hydrological, observations and exploration.
meteorological aids land station: meteorological aids mobile station: meteorological-satellite service: meteorological aids land station: meteorological aids mobile station: meteorological-satellite service:	A station in the meteorological aids service not intended to be used while in motion.
meteorological aids mobile station:	A station in the meteorological aids service intended to be used while in motion or during halts at unspecified points.
meteorological-satellite service:	An earth exploration-satellite service for meteorological purposes.
mobile earth station:	An <i>earth station</i> in the <i>mobile-satellite service</i> intended to be used while in motion or during halts at unspecified points.
mobile service:	A radiocommunication service between mobile and land stations, or between mobile stations (CV).
mobile station:	A <i>station</i> in the <i>mobile service</i> intended to be used while in motion or during halts at unspecified points.
mobile-satellite service:	A radiocommunication service: — between <i>mobile earth stations</i> and one or more <i>space stations</i> , or between <i>space stations</i> used by this service; or

Page | 8-137

	between <i>mobile earth stations</i> by means of one or more
	space stations.
	This service may also include <i>feeder links</i> necessary for its operation.
multi-satellite link:	A radio link between a transmitting <i>earth station</i> and a receiving <i>earth station</i> through two or more <i>satellites</i> , without any intermediate <i>earth station</i> . A multi-satellite link comprises one up-link, one or more satellite-to-satellite links and one down-link.
on-board communication station:	A low-powered <i>mobile station</i> in the <i>maritime mobile service</i> intended for use for internal communications on board a ship, or between a ship and its lifeboats and life-rafts during lifeboat drills or operations, or for communication within a group of vessels being towed or pushed, as well as for line handling and mooring instructions.
port operations service:	A maritime mobile service in or near a port, between coast stations and ship stations, or between ship stations, in which messages are restricted to those relating to the operational handling, the movement and the safety of ships and, in emergency, to the safety of persons. Messages which are of a public correspondence nature shall be excluded from this service.
port station:	A coast station in the port operations service.
primary radar:	A <i>radiodetermination</i> system based on the comparison of reference signals with radio signals reflected from the position to be determined.
public correspondence	Any <i>telecommunication</i> which the offices and <i>stations</i> must, by reason of their being at the disposal of the public, accept for transmission (CS).
radar beacon (racon):	A transmitter-receiver associated with a fixed navigational mark which, when triggered by a <i>radar</i> , automatically returns a distinctive signal which can appear on the display of the triggering <i>radar</i> , providing range, bearing and identification information.
radar:	A <i>radiodetermination</i> system based on the comparison of reference signals with radio signals reflected, or retransmitted, from the position to be determined.
radio	A general term applied to the use of radio waves.
radio altimeter:	Radionavigation equipment, on board an aircraft or spacecraft, used to determine the height of the aircraft or the spacecraft above the Earth's surface or another surface.
radio astronomy	Astronomy based on the reception of <i>radio waves</i> of cosmic origin.
radio astronomy service:	A service involving the use of <i>radio astronomy</i> .
radio astronomy station:	A station in the radio astronomy service.
radio astronomy:	Astronomy based on the reception of <i>radio waves</i> of cosmic origin.
radio direction-finding station:	A radiodetermination station using radio direction-finding.
radio direction-finding:	Radiodetermination using the reception of radio waves for the purpose of determining the direction of a station or object.
radiobeacon station:	A <i>station</i> in the <i>radionavigation service</i> the <i>emissions</i> of which are intended to enable a <i>mobile station</i> to determine its bearing or direction in relation to the radiobeacon station.
radiocommunication	Telecommunication by means of radio waves (CS) (CV).

Page | 8-138

radiocommunication service:	A service as defined in this Section involving the transmission, <i>emission</i> and/or reception of <i>radio waves</i> for specific <i>telecommunication</i> purposes. In these Regulations, unless otherwise stated, any radiocommunication service relates to <i>terrestrial radiocommunication</i> .
radiodetermination:	The determination of the position, velocity and/or other characteristics of an object, or the obtaining of information relating to these parameters, by means of the propagation properties of <i>radio waves</i> .
radiodetermination service:	A radiocommunication service for the purpose of radiodetermination.
radiodetermination Station:	A station in the radiodetermination service.
radiodetermination- satellite service:	A radiocommunication service for the purpose of radiodetermination involving the use of one or more space stations. This service may also include <i>feeder links</i> necessary for its own operation.
radio direction-finding	Radiodetermination using the reception of radio waves for the purpose of determining the direction of a station or object.
radiolocation land station:	A <i>station</i> in the <i>radiolocation service</i> not intended to be used while in motion.
radiolocation mobile station:	A <i>station</i> in the <i>radiolocation service</i> intended to be used while in motion or during halts at unspecified points.
radiolocation:	<i>Radiodetermination</i> used for purposes other than those of <i>radionavigation</i> .
radiolocation service:	A radiodetermination service for the purpose of radiolocation.
radiolocation-satellite service:	A radiodetermination-satellite service used for the purpose of radiolocation. This service may also include the <i>feeder links</i> necessary for its operation.
radionavigation	Radiodetermination used for the purposes of navigation, including obstruction warning.
radionavigation land station:	A <i>station</i> in the <i>radionavigation service</i> not intended to be used while in motion.
radionavigation mobile station:	A <i>station</i> in the <i>radionavigation service</i> intended to be used while in motion or during halts at unspecified points.
radionavigation service:	A radiodetermination service for the purpose of radionavigation.
radionavigation:	Radiodetermination used for the purposes of navigation, including obstruction warning.
radionavigation- satellite service:	A radiodetermination-satellite service used for the purpose of radionavigation. This service may also include <i>feeder links</i> necessary for its operation.
radiosonde:	An automatic radio transmitter in the <i>meteorological aids service</i> usually carried on an aircraft, free balloon, kite or parachute, and which transmits meteorological data.
radiotelegram	A telegram, originating in or intended for a mobile station or a mobile earth station transmitted on all or part of its route over the radiocommunication channels of the mobile service or of the mobile-satellite service.
radiotelex call	A telex call, originating in or intended for a mobile station or a mobile earth station, transmitted on all or part of its route over the radiocommunication channels of the mobile service or the mobile-satellite service.
radio waves or hertzian	Electromagnetic waves of frequencies arbitrarily lower than 3 000 GHz,

Page | 8-139

	manageted in anges with out outificial: 1-
waves	propagated in space without artificial guide
safety service:	Any <i>radiocommunication service</i> used permanently or temporarily for the safeguarding of human life and property.
satellite emergency position-indicating radiobeacon:	An <i>earth station</i> in the <i>mobile-satellite service</i> the <i>emissions</i> of which are intended to facilitate search and rescue operations.
satellite link:	A radio link between a transmitting <i>earth station</i> and a receiving <i>earth station</i> through one <i>satellite</i> . A satellite link comprises one up-link and one down-link.
satellite network:	A <i>satellite system</i> or a part of a <i>satellite system</i> , consisting of only one <i>satellite</i> and the cooperating <i>earth stations</i> .
satellite system:	A space system using one or more artificial earth satellites.
secondary radar:	A <i>radiodetermination</i> system based on the comparison of reference signals with radio signals retransmitted from the position to be determined.
ship earth station:	A mobile earth station in the maritime mobile-satellite service located on board ship.
ship movement service:	A safety service in the maritime mobile service other than a port operations service, between coast stations and ship stations, or between ship stations, in which messages are restricted to those relating to the movement of ships. Messages which are of a public correspondence nature shall be excluded from this service.
ship station:	A <i>mobile station</i> in the <i>maritime mobile service</i> located on board a vessel which is not permanently moored, other than a <i>survival craft station</i> .
ship's emergency transmitter:	A ship's transmitter to be used exclusively on a distress frequency for distress, urgency or safety purposes.
space operation service:	A radiocommunication service concerned exclusively with the operation of spacecraft, in particular space tracking, space telemetry and space telecommand. These functions will normally be provided within the service in which the <i>space station</i> is operating.
space radiocommunication	Any <i>radiocommunication</i> involving the use of one or more <i>space stations</i> or the use of one or more <i>reflecting satellites</i> or other objects in space.
space research service:	A <i>radiocommunication service</i> in which <i>spacecraft</i> or other objects in space are used for scientific or technological research purposes.
space station:	A <i>station</i> located on an object which is beyond, is intended to go beyond, or has been beyond, the major portion of the Earth's atmosphere.
space system:	Any group of cooperating <i>earth stations</i> and/or <i>space stations</i> employing <i>space radiocommunication</i> for specific purposes.
special service:	A <i>radiocommunication service</i> , not otherwise defined in this Section, carried on exclusively for specific needs of general utility, and not open to <i>public correspondence</i> .
standard frequency and time signal service:	A <i>radiocommunication service</i> for scientific, technical and other purposes, providing the transmission of specified frequencies, time signals, or both, of stated high precision, intended for general reception.
standard frequency and time signal station:	A station in the standard frequency and time signal service.
standard frequency and time signal-satellite service:	A radiocommunication service using space stations on earth satellites for the same purposes as those of the standard frequency and time signal service.

Page | 8-140

	This service may also include <i>feeder links</i> necessary for its operation.
station:	One or more transmitters or receivers or a combination of transmitters and receivers, including the accessory equipment, necessary at one location for carrying on a <i>radiocommunication service</i> , or the <i>radio astronomy service</i> . Each station shall be classified by the service in which it operates permanently or temporarily.
survival craft station:	A <i>mobile station</i> in the <i>maritime mobile service</i> or the <i>aeronautical mobile service</i> intended solely for survival purposes and located on any lifeboat, life-raft or other survival equipment.
telecommunication	Any transmission, emission or reception of signs, signals, writings, images and sounds or intelligence of any nature by wire, radio, optical or other electromagnetic systems (CS).
telegraphy	A form of telecommunication in which the transmitted information is intended to be recorded on arrival as a graphic document; the transmitted information may sometimes be presented in an alternative form or may be stored for subsequent use (CS 1016).
telephony	A form of telecommunication primarily intended for the exchange of information in the form of speech (CS 1017).
telegram	Written matter intended to be transmitted by telegraphy for delivery to the addressee. This term also includes radiotelegrams unless otherwise specified (CS). In this definition the term telegraphy has the same general meaning as defined in the Convention.
terrestrial radiocommunication	Any radiocommunication other than space radiocommunication or radio astronomy
terrestrial station:	A station effecting terrestrial radiocommunication. In these Regulations, unless otherwise stated, any <i>station</i> is a terrestrial station.
